General Purpose Solenoid Valves

Skinner™ and Gold Ring™ Valves

Effective September 2011

Parker

ENGINEERING YOUR SUCCESS.

About Fluid Control Division

Parker Fluid Control Division (FCD) is a world-wide industry leader of solenoid valves that control motion, flow and pressure in a wide variety of applications in all markets. Since 1947, it has built a strong reputation as a recognized leader in solenoid valve technology and design – first as Skinner Valve Division, then with the addition of Lucifer Division (Geneva) in 1984, Gold Ring (Fluidex Division) in 1986 and SCEM (Italy) in 1989.

With manufacturing facilities strategically placed around the world, FCD is prepared to meet your global needs. Facilities located in the United States, Brazil, Italy, Switzerland, China, South Korea and India are equipped with a complete staff of experienced design engineers – among the best in the business – that are capable of rapidly completing customized valve designs for specific user requirements. Each facility has well equipped evaluation and testing laboratories to ensure proper valve operation, long cycle life, and optimum reliability.

With sales affiliates worldwide, an extensive distribution network and broad product breadth, FCD is in a unique position to service the world's requirements for solenoid valves.

Together we can control a wide variety of media, in hundreds of markets, under all conditions with thousands of designs that have been qualified to the most rigorous industry standards.

You'll find our products in OEM equipment for markets such as transportation, food & beverage, medical & instrumentation, fuel dispensing, refrigeration and air conditioning, industrial dishwashing and laundry equipment, as well as being specified on applications in process markets such as oil & gas, food processing, pharmaceutical, pulp & paper, tire & rubber, etc.

Fluid Control Division Headquarters, New Britain, CT.

Fluid Control Division Facility, Madison, MS.

Together we can work with you to cross over most all major competitive products to our wide variety of standard valves or work with your application specifications to select one of our unique product solutions.

All FCD valves come with an industry leading two year warranty against defects in workmanship.

Distribution

Our distribution network stocks 2-way, 3-way and 4-way valves that are engineered to control virtually any media over a wide range of applications. For a complete listing of our distribution network, please visit www.parker.com/fcd and select "where to buy."

FCD partners with our extensive distribution network and their end-users to ensure that their needs are met and all systems kept up and running!

System Solutions: Engineering Your Success

Besides offering superior products through our distribution network, FCD also works with distribution and OEMs to find value added solutions to satisfy your application's unmet needs.

Together we can partner with you and utilize the power of Parker's expertise in technology and innovation to create a world class system solution just for you.

FCD has cutting edge design and prototyping capabilities along with a staff of the industry's top engineers that will assist you with creating your next generation of solenoid valve solutions.

Combine all that with Parker's Premier Customer Service, and you've got a real winning team to partner with.

ISO 9001:2008

WARNING – USER RESPONSIBILITY

FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THE PRODUCTS AND/OR SYSTEMS DESCRIBED HEREIN OR RELATED ITEMS CAN CAUSE DEATH, PERSONAL INJURY AND PROPERTY DAMAGE.

This document and other information from Parker-Hannifin Corporation, its subsidiaries and authorized distributors provide product and/or system options for further investigation by users having technical expertise. It is important that you analyze all aspects of the application, follow applicable industry standards, and follow the information concerning the product in the current product catalog and in any other materials provided from Parker or its subsidiaries or authorized distributors. Due to the variety of operating conditions and applications for these products or systems, the user, through its own analysis and testing, is solely responsible for making the final selection of the system and components and assuring that all performance, endurance, maintenance, safety and warning requirements of the application are met.

To the extent that Parker or its subsidiaries or authorized distributors provide component or system options based upon data or specifications provided by the user, the user is responsible for determining that such data and specifications are suitable and sufficient for all applications and reasonably foreseeable uses of the components or systems.

The product described herein, including without limitation, product features, specifications, designs, availability and pricing, are subject to change by Parker Hannifin Corporation and its subsidiaries at any time without notice.

OFFER OF SALE

The items described in this document are hereby offered for sale by Parker-Hannifin Corporation, its subsidiaries or its authorized distributors. This offer and its acceptance are governed by the provisions stated on the separate page of this document entitled "Terms and Conditions of Sale."

Table of Contents

How to order (see coil section for part numbering charts)

Valves using Coil Charts 1-6 (Gold Ring Series Valves)

Step 1: Select the pressure vessel catalog number based on the application requirements. The catalog number is specified in the individual catalog sections.

Step 2: Select one enclosure code, one coil termination code and one voltage code. Standard leads are 18-inches long with all enclosures, except splice box where six-inch leads are standard.

Step 3: When separate valve and solenoid, the last two digits of the valve must match the first two digits of the solenoid. **Example:** Valve: 04F20C1103AAF Solenoid: AF4C05

Step 4: Valves with enclosure Types 7 & 9 must be ordered factory assembled and not as modular.

Valves using Coil Charts 7, 8, 10, 11 & 12 (Skinner 7000 Series Valves)

Ordering items 1 and 2, fully assembled valves

Step 1: Select the pressure vessel catalog number based on the application requirements. The catalog number is specified in the individual catalog sections.

Step 2: Use the mechanical options table, if required, to write the option code in place of the last two pressure vessel digits - "00."

Step 3: Select the appropriate integrated coil, and enter (N0=Nut & Washer as the 13th/14th digits), or enclosure and conventional coil.

Step 4: Use the electrical options table, if required, to write the option code in place of the last two coil digits.

Step 5: Use the voltage code to specify the correct voltage for the valve.

Item	Description
1	Fully assembled valves with integrated coils
2	Fully assembled valves with conventional coils and enclosures

Pressure Vessels		Enclosure		Coil		Voltage Code
7121KBN2NV00	+	N0	+	C111	+	P3

Example: 7121KBN2NV00N0C111P3

Valves using Coil Chart 9 (Miniature 2-way/3-way valves and Miniature Manifold Mounted Cartridge Valves)

These valves can be ordered in two parts: pressure vessel and solenoid coil.

To order modular units, select the pressure vessel, then mix and match one of the three different coil styles to meet your application requirement.

The available modular coils consist of the following coils:

- C4 conduit coil
- B4 leaded coil
- D6 DIN coil

To order pressure vessel:
Choose your pressure vessel from the the technical specification pages. The pressure vessel will contain the required coil retainig nut.

To order coil:

- Select either the C4 (Conduit), B4 (leaded) or D6 (DIN) coil required.
- Select voltage code
- Add voltage code to end of the coil number
- The coil assembly will contain the O-ring seals.

Assembled Valve Units:
To order a complete valve follow these three easy steps:

Step 1: Choose your pressure vessel from the technical specification pages.

Step 2: Select either the encapsulated (Integrated) or conventional coil. Apply that two-digit code to the end of the pressure vessel part number.

Step 3: Lastly, go to the voltage code chart and select the one digit voltage code and add the code to the end of the coil code to create the final complete assembled valve part number.

2-Way Miniature

Direct Acting Valves
1/8" NPT

General Description:

2-way Miniature Direct Acting valves are available in Normally Closed and Normally Open constructions with interchangeable AC/DC coils. Valves are standard with 303 stainless steel bodies and FKM seals. These compact valves are durable with the potential for long life. Under lab conditions, these valves have survived 20 million cycles.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page A4

Compatible Fluids
Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and additional fluids compatible with materials of construction.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24
For other voltages – consult factory

Coil Classification:

Class F standard/Class H available AC & DC coils are interchangeable on the same pressure vessel.

Agency Approvals:
Standard valves with NEMA 4X are C-UL-US Listed or Recognized. For additional details, consult factory.

NSF Certification available on 2-way Normally Closed Valves. (Consult Factory)

Maximum Ambient Temperature
135°F (AC)/125°F (DC)

In absence of moisture, applications at temps as low as -20°F are possible. Please refer to page A4 for details.

Applications:

- Instrumentation equipment
- Analyzers and diagnostic equipment
- Gas analyzers
- Medical and dental equipment
- Portable welding equipment
- Spraying equipment
- Lubrication equipment
- Beverage dispensing & vending machines
- Oil burners
- Humidification and misting equipment
- Mobile fuel shut off
- Textile and dry cleaning equipment
- Air horns
- Pneumatic fan clutch
- Irrigation equipment

* Shows the first 6 digits of the pressure vessel part number.

** Maximum ambient temperature shown is the rating when valve is operating at the maximum fluid temperature as shown in the product sections for each of the valves in this catalog.

Check out the 2-Way and 3-Way Manifold Mounted Miniature Cartridge valves in the Specialty Section of this catalog.

Product Features:

- Space saving approach
- Less manifold machining means lower overall manifold cost
- No manifold orifices to machine or press in
- Cartridge valves are 100% tested
- Easy to assemble & disassemble with a 5/32" hex wrench. (Torque = 25-35 in-lbs).
- No loose parts: sleeve, plunger, spring and orifice are pressed together as one unit
- Available with all coils and enclosures shown on Chart 9 in Coil Section of this catalog.

2-way

Direct Acting Valves
1/8" - 3/4" NPT

General Description:

2-way Direct Acting valves are used in a wide variety of applications that require zero pressure differential and medium to high pressures and flow. These valves are available in a variety of elastomers as well as, brass and stainless construction.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page A24

Compatible Fluids
Lubricated Air, Inert Gases, Water and Light Oil (300 SSU). Additional fluids compatible with alternate materials of construction (consult factory).

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other Voltages – consult factory

Coil Classification:
Class F standard
Class H available

Agency Approvals:
Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

Maximum Ambient Temperature
150°F

Please refer to page A24 for details.

Applications:

- Instrumentation equipment
- Analyzers and diagnostic equipment
- Medical and dental equipment
- Portable welding equipment
- Spraying equipment
- Lubrication equipment
- Beverage dispensing & vending machines
- Oil burners
- Humidification and misting equipment
- Mobile fuel shut off
- Textile and dry cleaning equipment
- Air horns
- Pneumatic fan clutch
- Irrigation equipment

2-Way

Direct Lift, Pilot & Remote Operated Valves
1/4"–2" NPT

General Description:

2-Way Direct Lift, Pilot & Remote Operated valves are designed for higher flow and medium to high pressure applications. Pilot operated valves require the minimum pressure differential specified for proper valve operation.

Installation
Valves should be mounted with solenoid coil vertical and upright.

Standard Materials of Construction
Please refer to page A55

Compatible Fluids
Lubricated Air, Inert Gases, Water and Light Oil (300 SSU). Additional fluids compatible with alternate materials of construction (consult factory).

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory

Coil Classification:
Class F standard
Class H available

Agency Approvals:
Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

Maximum Ambient Temperature
150°F
Please refer to page A55 for details.

Applications:

- Irrigation systems
- Fire suppression equipment
- Molding equipment
- Cooling of machine tools
- Sterilizers
- Car wash
- Water treatment and purification
- Air compressors and dryers
- Floor cleaning equipment
- Hospital equipment
- Automated systems
- Food processing

***External pilot pressure valves require a minimum external pilot pressure equal to the main line pressure plus 10 psi. Maximum external pilot pressure is 145 psi for vacuum applications and 160 psi for pressure applications. (Pressure ratings may be reduced, however. Consult factory for details.)**

2-Way

Direct Acting & Pilot Operated
High Pressure
1/8" - 3/4" NPT

General Description:

2-Way Direct Acting and Pilot Operated High Pressure valves are generally installed where high pressure and large flow requirements dictate the use of piston valves and/or valves with more robust seals such as PTFE and Ruby discs*. Pilot Operated valves require the minimum pressure differential specified for proper valve operation.

Installation
Pilot Operated Valves should be mounted with solenoid coils vertical and upright. Direct Acting valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page A73.

Compatible Fluids
Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and other non-compressible media.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory

Coil Classification:
Class F standard
Class H available

Agency Approvals:

Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

Maximum Ambient Temperature
150°F

Please refer to page A73 for details.

Applications:

- Blow molding
- Compressors
- Car washing equipment
- Pumps

2-Way

Anti-Water Hammer & Slow Closing Valves
3/8" - 2" NPT

General Description:

2-way Anti-Water Hammer and Slow Closing valves are designed for liquid applications where the installation is susceptible to shock waves caused by the abrupt closing of the valves. Anti-water hammer valves have integral speed control so that the valve closes in a more controlled and slower manner, thus eliminating the shock to the system piping. Pilot operated valves require the minimum pressure differential specified for proper valve operation.

Installation
Valves should be mounted with solenoid coils vertical and upright.

Standard Materials of Construction
Please refer to page A80

Compatible Fluids
Water, hydraulic fluids and other non-compressible media.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory

Coil Classification:
Class F standard
Class H available

Agency Approvals:
Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory

Maximum Ambient Temperature
150°F

Please refer to page A80 for details.

Applications:

- Used in applications on water or other non-compressible liquids where normal operation may cause a 'water hammer' effect which results in shockwaves to the system that can damage the piping or other components.

3-Way Miniature

Direct Acting Valves
1/8" NPT

General Description:

3-way Miniature Direct Acting valves are suitable for low to medium pressure applications that do not require a minimum operating pressure differential, for actuation. Available in normally open, normally closed, or universal operation. Tested to 20 million cycles under lab conditions. Standard with 303 stainless steel bodies and FKM seals.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page B4.

Compatible Fluids
Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and additional fluids compatible with materials of construction.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24
For other voltages – consult factory

Coil Classification:
Class F standard
Class H available
AC & DC coils are interchangeable on the same pressure vessel.

Agency Approvals:
Standard valves with NEMA 4X are C-UL-US listed and CSA certified.
For additional details, consult factory.

Maximum Ambient Temperature
135°F (AC); 125°F (DC)
In the absence of moisture, applications as low as -20°F are possible.

Please refer to Page B4 for details.

Applications:

- Single acting spring return cylinder control
- Selection or diversion of process media
- HVAC damper control
- Instrumentation
- Pneumatic positioning
- Automatic dispensing equipment
- Small compressors
- Water treatment
- Air dryers
- Medical & dental equipment
- Damper control

* Shows the first 6 digits of the pressure vessel part number.

** Maximum ambient temperature shown is the rating when valve is operating at the maximum fluid temperature as shown in the product sections for each of the valves in this catalog.

Check out the 2-Way and 3-Way Manifold Mounted Miniature Catridge valves in the Specialty Section of this catalog.

Product Features:

- Space saving approach
- Less manifold machining equals lower manifold cost
- No manifold orifices to machine or press in
- Easy to assemble & disassemble with a 5/32" hex wrench (Torque = 25-35 in-lbs)
- Cartridge valves are 100% tested
- No loose parts: sleeve, plunger, spring and orifice are pressed together as one unit
- Available with all coils/enclosures from Chart 9 in the Coil Section of this catalog

3-Way

Direct Acting Valves
1/8" - 1/4" NPT

General Description:

3-way Direct Acting valves are suitable for low to medium pressure applications that do not require a minimum operating pressure differential. Available in normally open, normally closed and universal operation.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page B23.

Compatible Fluids
Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and additional fluids compatible with materials of construction.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other Voltages – Consult Factory

Coil Classification:
Class F Standard, Class H Available
Class B Coils (Std. on A-Series Valves)

Agency Approvals:

Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

SIL-3 Capable (Models 7131Txx, 7132Txx, 7133Txx). See Certificate in Technical Section Page F19.

Maximum Ambient Temperature
167°F

Please refer to Page B23 for details.

Applications:

- Single acting spring return cylinder control
- Selection or diversion of process media
- HVAC damper control
- Instrumentation
- Pneumatic positioning
- Automatic dispensing equipment
- Gas sampling
- Small compressors
- Water treatment
- Air dryers

3-Way Direct Acting - Normally Closed - Brass

***Ordering A Series Valves:**

A Series Valves must be ordered as complete part numbers (These are Class B coils).

1) Select pressure vessel part number from above (i.e. A3LB2252)
2) Choose coil/enclosure part number from table below for required voltage

Voltage	24/60	120/60	240/60	12VDC	24VDC
Coil Code	AB2A44	AB6A46	AB8A48	DC1A22	DC2A23
Coil Part Number*	AB720S24	AB728S24	AB731S24	A7724F24	A7727F24

*When ordering a replacement coil, use Coil Part Number (not Coil Code)

3) Complete P/N for 120/60 is A3LB2252AB6A46

***Ordering A Series Valves:**

A Series Valves must be ordered as complete part numbers (These are Class B coils).

1) Select pressure vessel part number from above (i.e. A3LB2252)
2) Choose coil/enclosure part number from table below for required voltage

Voltage	**24/60**	**120/60**	**240/60**	**12VDC**	**24VDC**
Coil Code	**AB2A44**	**AB6A46**	**AB8A48**	**DC1A22**	**DC2A23**
Coil Part Number*	**AB720S24**	**AB728S24**	**AB731S24**	**A7724F24**	**A7727F24**

*When ordering a replacement coil, use Coil Part Number (not Coil Code)

3) Complete P/N for 120/60 is A3LB2252AB6A46

3-Way

Pilot & Remote Operated Valves
1/4" - 3/4" NPT

General Description:

3-Way Pilot Operated valves are used in general industrial applications and control valve pilot actuation where higher pressures and flows are required. Pilot operated valves require the minimum operating pressure differential specified to ensure proper operation.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

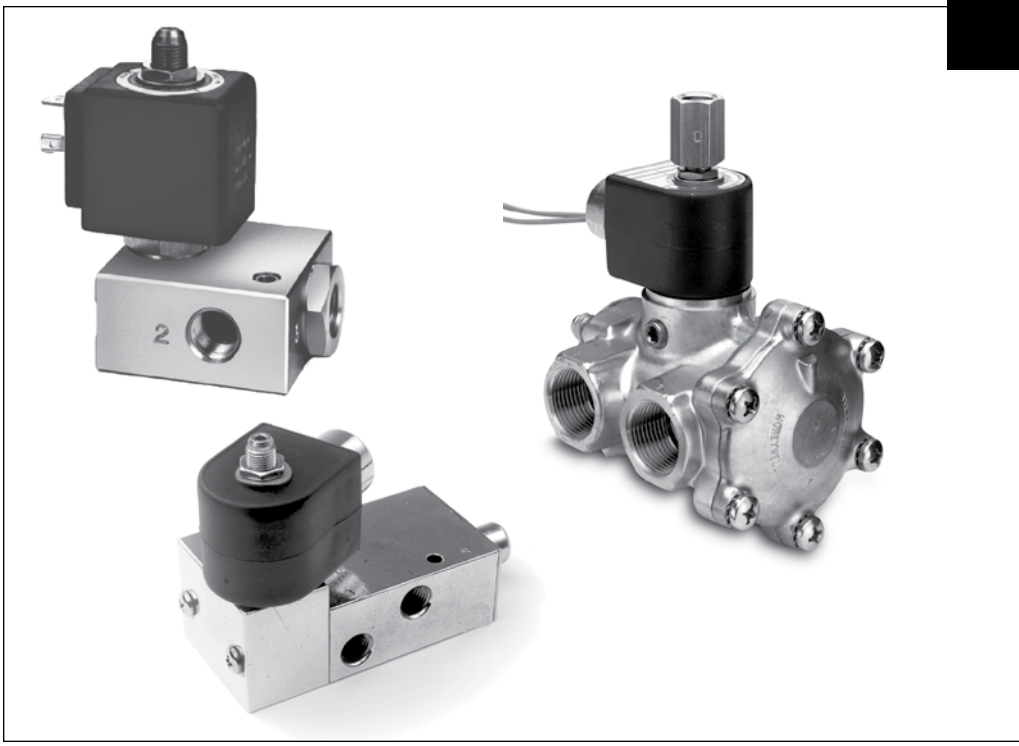
Standard Materials of Construction
Please refer to page B40.

Compatible Fluids
Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and additional fluids compatible with materials of construction, as listed in the product specifications charts.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12,24 & 120
For other voltages – consult factory



Coil Classification:
Class F Standard – Class H Available

Agency Approvals:
Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified.

SIL-3 Capable (Models 73317xx, 74317xx). See Certificate in Technical Section Page F20 For additional details, consult factory.

Maximum Ambient Temperature
167° F

Mininum Ambient Temperature
-40°F for Models 73317xx and 74317xx. Dew Point must be more than 7°F below ambient.

Applications:

- Pilot valve actuation of larger control valves
- Oil and gas including off-shore installations
- Single acting spring return cylinder control
- Compressor unloaders
- Turbines

External Piloted 74332xxx
- Controlling Contaminated Fluids
- Controlling Pressures under 10 PSI
- Operating valves on vacuum

Please refer to page B40 for details

***Minumum external pilot pressure must be main line pressure plus 10 psi; 180 psi maximum; 165 psi maximun for vacuum applications.**

External Pilot Pressure Valves
When an application requires the separation of the fluid in the main line from the pilot operator, it is necessary to control the pilot externally.

Examples include:
- Controlling contaminated fluids up to 170 PSI
- Controlling pressures below the minimum
- Operating valves on vacuum

For such applications, the following 3-way multipurpose valves are provided with connections for external pressure to operate the pilot. The minimum external pilot pressure required is the main line pressure plus 10 PSI. The maximum external pilot pressure is 180 PSI for pressure applications, and 165 PSI for vacuum applications.

For vacuum service the vacuum line must be connected to the normally open port, and pilot pressure must be connected to the normally closed pilot port.

3-Way

Direct Acting High Pressure Valves
1/8" - 1/4" NPT

General Description:

3-way Direct Acting High Pressure valves are used in general industrial application and control valve pilot actuation where higher pressures and flows are required. No minimum operating pressure differential required to ensure proper operation.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page B44.

Compatible Fluids
Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and additional fluids compatible with materials of construction, as listed in the product specifications charts.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12,24 & 120
For other voltages – consult factory

Coil Classification:
Class F standard
Class H available

Agency Approvals:
Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

Maximum Ambient Temperature
150° F

Please refer to Page B44 for details.

Applications:

- Pilot valve actuation of larger control valves
- Oil and gas including off-shore installations
- Single acting spring return cylinder control
- Compressor unloaders
- Turbines
- Machining equipment
- High pressure compressors

3-Way

Direct Acting & Pilot Operated Quick Exhaust Valves 1/4" - 3/8" NPT

General Description:

3-Way Direct Acting & Pilot Operated Quick Exhaust Valves are designed to provide a large orifice for quick exhaust. Increased exhaust capacity significantly reduces cycle time for single acting spring return actuators. Pilot operated valves require the minimum operating pressure differential specified to ensure proper operation. Direct acting valves do not require a pressure differential.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page B50.

Compatible Fluids
Lubricated air, inert gases, water, light oil (300 SSU) and additional fluids compatible with materials of construction, as listed in the product specifications.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory.

4-Way

Direct Acting & Pilot Operated Valves
1/8" - 1/2" NPT

General Description:

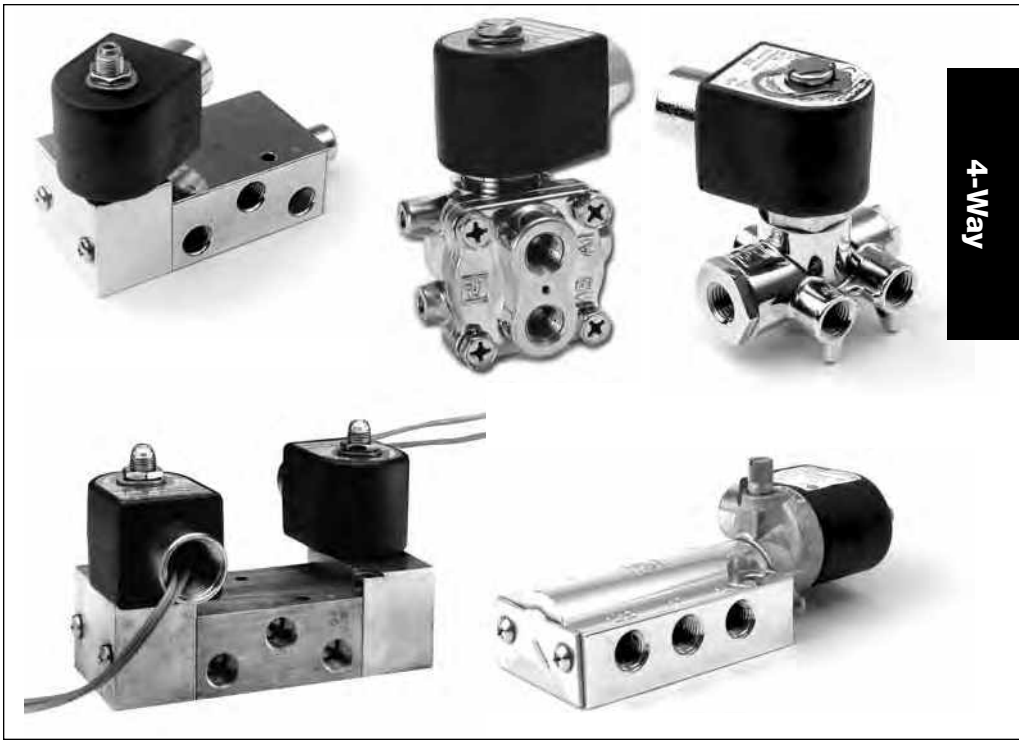
4-Way Direct Acting and Pilot Operated valves are used in applications for actuation of double acting cylinders and piloting of larger control valves. Pilot operated valves require the minimum operating pressure differential specified to ensure proper operation. Direct Acting valves do not have a minimum pressure differential requirement.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
Please refer to page C15.

Compatible Fluids
Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and additional fluids compatible with materials of construction, as shown in the product specification charts.

Use of non-lubricated gaseous media can affect valve life.



Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory

Coil Classification:
Class F standard, Class H available
Class B standard on V9xx models

Agency Approvals:
Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. (Consult Factory for Approvals on Models V933, V935 and V955).

SIL-3 Capable (Models 73417xx, 74417xx, 73477xx). See certificate on page F20 in the Technical section of this catalog. For additional details, consult factory.

Maximum Ambient Temperature
167°F

Minimum Ambient Temperature
-40°F for models 73417xx, 74417xx and 73477xx. Dew point must be more than 7°F below ambient.

Applications:

- Pilot valve actuation of control valves
- Oil and gas including off-shore
- Double acting cylinder control
- Air vises and Air motors
- Damper control

Please refer to page C15 for details.

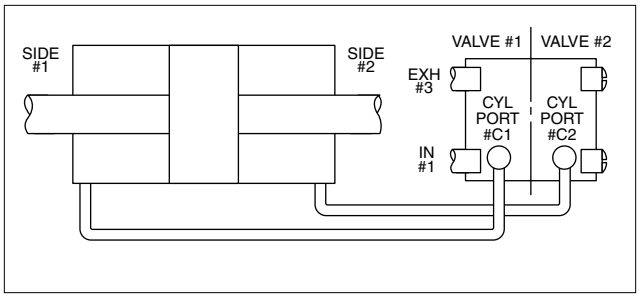
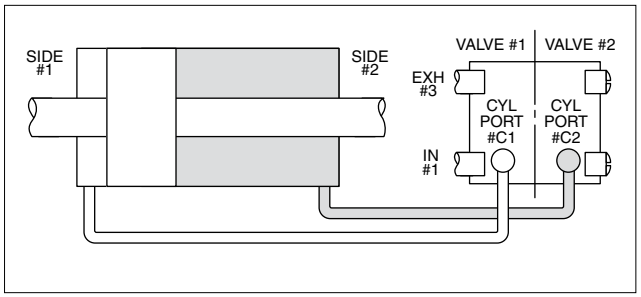
V933 Four-Way Normally Closed - Normally Closed Valves

When de-energized, both inlet ports are closed by the two plungers preventing flow from the common inlet through both of the valves. The cylinder port in each valve is open to the common exhaust, permitting flow from the cylinders to the exhaust. When the coils are energized, both valve plungers rise, opening the inlet orifices, and at the same time closing the orifices in the sleeves. This stops flow from the cylinder ports to the exhaust, and permits flow from the inlet to the cylinder ports.

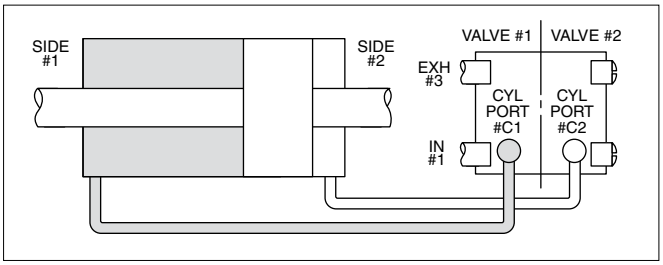


Typical cylinder operation with V933 Valves

Both coils de-energized. The inlet pressure is closed to both sides of a double-acting cylinder. Side #1 and Side #2 of the cylinder are open to exhaust through cylinder ports #C1 and #C2. The piston can be shifted manually.



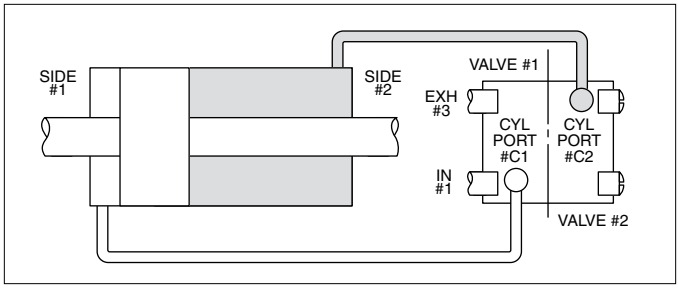
Coil of valve #1 energized; coil of valve #2 de-energized. The inlet pressure is open to side #1 of the double-acting cylinder through cylinder port #C1, the exhaust is closed off by the plunger insert. Side #2 of the cylinder is open to exhaust through cylinder port #C2, the inlet is closed off by the plunger insert. The piston moves to the right.



Coil of valve #1 de-energized; coil of valve #1 energized. The inlet pressure is closed off to side #1 of the double-acting cylinder; the exhaust is open through cylinder port #C1. Side #2 of the cylinder is closed to the exhaust and open to inlet pressure through cylinder port #C2. The piston moves to the left.

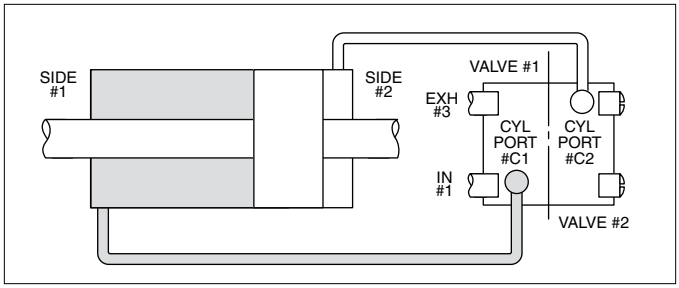
V935 Four-Way Normally Closed - Normally Open Valves

The plungers of the two valves are at opposite positions in both the energized and de-energized conditions - one normally open while the other is normally closed. When de-energized, fluid flows from the inlet of the valve through the inlet port of the normally open valve, through the sleeve, and out the cylinder port of the valve. At the same time, the normally closed valve inlet orifice is closed, but the orifice in the sleeve is opened, permitting flow from its cylinder port to the common exhaust. Therefore, fluid flows from the inlet of the valve to the cylinder port of the normally open valve and from the cylinder port of the normally closed valve to the exhaust. When energized, the two valves reverse in position.



Typical cylinder operation with V935 Valves

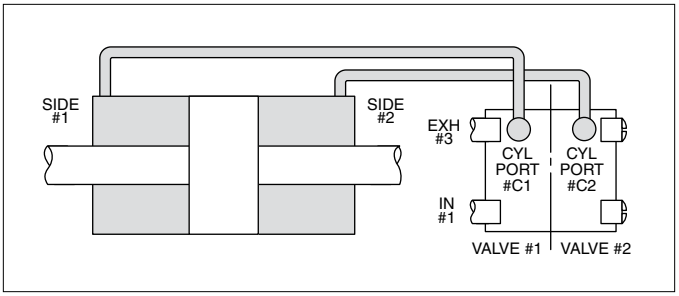
Both coils de-energized. The inlet pressure is open to side #2 of the double-acting cylinder through cylinder port #C2 and the plunger insert closes off the exhaust. Side #1 of the cylinder is open to exhaust through cylinder port #C1 and the inlet pressure is closed off. This causes the piston in the cylinder to move to the left.



Both coils energized. The inlet pressure is open to side #1 of the cylinder through cylinder port #C1 and the exhaust is closed off. Side #2 of the cylinder is open to the exhaust through cylinder port #C2 and the inlet pressure is closed off by the plunger insert. The piston moves to the right.

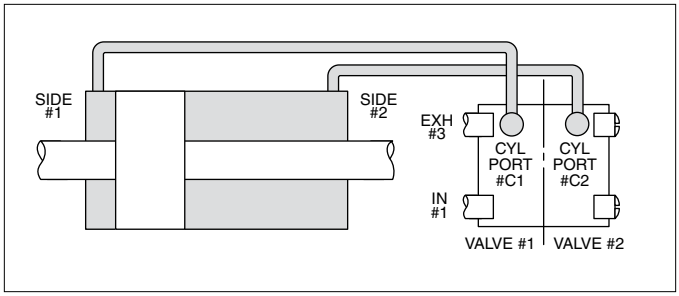
V955 Four-Way Normally Open - Normally Open Valves

Both plungers are in the same position when the coils are de-energized. In this condition, fluid flows through the common inlet of the body, up through the sleeves of both valves, and out the cylinder ports of the valves. Both orifices in the sleeve stops are closed to the exhaust ports by the plunger. In the energized position, both valve plungers operate together to close the inlet ports, stopping flow into the valve. At the same time, the orifices in the sleeves are opened permitting flow from the cylinder ports to the common exhaust port in the body.



Typical cylinder operation with V955 Valves

Both coils de-energized. The inlet pressure is open to both sides of the double-acting cylinder through cylinder port #C2 and the plunger insert closes off the exhaust. Side #1 of the cylinder is open to exhaust through cylinder port #C1 and the inlet pressure is closed off. This causes the piston in the cylinder to move to the left.



Coil of valve #1 energized; coil of valve #2 de-energized. The inlet pressure is closed to side #1 of the double-acting cylinder and open to exhaust through cylinder port #C1. Side #2 of the cylinder is open to the inlet pressure, through cylinder port #C2. The exhaust is closed off by the plunger insert. The piston moves to the left.

Direct Mount NAMUR

3/2, 3-Way — 5/2, 4-Way
Direct Acting and Pilot Operated Valves
1/4" - 1/2" NPT

General Description:

The NAMUR mounting interface for direct mount pilot valves has become widely popular around the world. Parker's Direct Mount NAMUR valves meet that global need and are supplied with the necessary mounting hardware and seals as standard to ensure proper mounting, interface sealing and valve function. These valves can be converted between 3-way and 4-way operation by using Parker's patented mounting conversion plate which is unique in the industry. (See Conversion Plate Kit on P. C22)

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright

Standard Materials of Construction
Please refer to page C22.

Compatible Fluids
Lubricated Air and Inert Gases.

Use of non-lubricated gaseous media can affect valve life.

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory

Coil Classification:
Class F standard
Class H available

Agency Approvals:
Standard valves with NEMA Type 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

SIL-3 Capable (Models 73417xxx, 73477xxx). See certificate on page F20 in Technical Section of this catalog.

Please refer to page C22 for details.

Minimum Ambient Temperature
-40° F (Dew point must be more than 7° F below ambient temp.

Maximum Ambient Temperature
167° F

Applications:

- Pilot valve actuation of larger control valves
- Oil and gas applications including off-shore installations
- Double acting cylinder control requiring direct pilot mount valves
- Air Vises
- Air Motors
- Damper Control

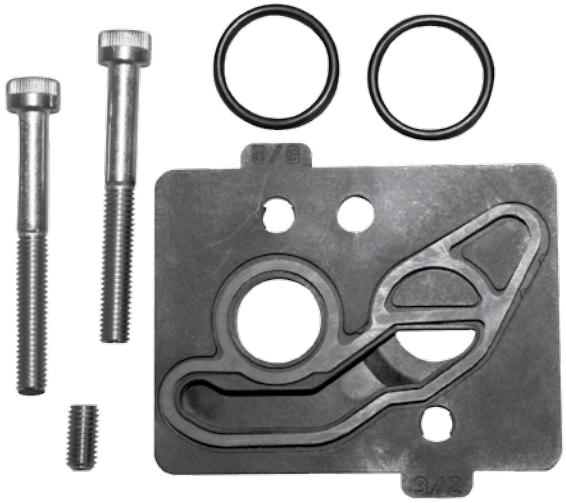
Parker's 3-way/4-way Conversion Mounting Plate Kit



This conversion mounting kit, unique in the industry, allows a common valve to be installed and used in either a 3-way or 4-way function.

Available with U.S., or Metric mounting screws. Consult factory for the specific kit number that meets your requirements.

Specialty Service

Valve Portfolio

General Description:

Parker Fluid Control Division offers a wide variety of products for many Specialty Applications**.**

In this section:

- Manifold mounted miniature cartridge valves
- MB 3-way miniature - plastic
- Dry operator 2-way
- Hot water and steam valves
- Intrinsically safe series
- Manual reset / 3-way
- Hydraulic 2-way & 3-way
- Magnelatch® coil option
- Fuel dispensing valves
- Fuel selector manifold
- CNG valves
- Timer drain valves

Specialty

Parker's solenoid valves have been sold in many markets for more than 60 years. Over that time, the offering has continually expanded to become a very extensive family of valves for both general purpose and special purpose applications.

This section details Fluid Control Division's special purpose line of valves. These valves were developed from years of experience in these specialty markets along with a thorough understanding of the unique needs required to ensure optimal performance.

The valves in this section have NPT threads as standard, or specialty flange configurations and are equipped with coils and housings when needed that are designed to meet the National Electric Code in the US and Canadian standards. Most all of these valves are UL listed and CSA certified.

Consult factory for further details.

Manifold Mounted Miniature Cartridge Valves

2-Way & 3-Way Direct Acting Miniature Cartridge Valves

General Description:

The manifold mounted miniature Cartridge Valve is offered in two- and three-way models with a stainless steel body. It offers a space-saving approach, with no manifold orifices to machine or press in, since the orifice is integral to the cartridge valve. Ultimately, less machining means lower manifold costs.

These cartridge valves come fully assembled with no loose parts – the sleeve, plunger, spring and orifice are pressed together as one unit.

Installation

Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction

Please refer to page D8.

Compatible Fluids

Lubricated Air, Inert Gases, Water, Light Oil (300 SSU) and additional fluids compatible with materials of construction.

Use of non-lubricated gaseous media can affect valve life.

Specialty

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24
For other voltages – consult factory

Coil Classification:

Class F standard
Class H available

AC & DC coils are interchangeable on the same pressure vessel.

Agency Approvals:
Standard valves with NEMA 4X are C-UL-US Listed or Recognized. For additional details, consult factory.

Maximum Ambient Temperature
135°F (AC)/125°F (DC)

In absence of moisture, applications at temps as low as -20°F are possible. Please refer to page D8 for details.

Applications:

- Analyzers and diagnostic equipment
- Medical and dental equipment
- Beverage dispensing and vending machines
- Humidification and misting equipment
- Pneumatic positioning
- Automatic dispensing equipment
- Irrigation equipment
- Instrumentation panels
- Lubrication equipment
- Refrigerant reclaim
- Automotive diagnostics/service

Product Features:

- Space saving approach
- Less manifold machining means lower manifold cost
- No manifold orifices to machine or press in
- Cartridge valves are 100% tested
- Easy to assemble and disassemble with a 5/32" hex wrench to a torque of 25-35 in-lbs.
- Available with all coil options from Chart 9 in coil section.

Plastic Body Valves/Zinc Manifold Base

General Description:

MB Series valves are designed for the actuation of small air cylinders and clamps, and are suited for applications requiring low air flow.

For manifolding, 2 or 3 station bases are offered. Manifolds can be bolted together to provide the desired banking combination.

The valves are direct acting, multipurpose valves with all ports in the body. The valve body is molded from plastic, while the internal parts are nylon, polyester and stainless steel. The valves will operate at up to 150 PSI, consuming only 4 watts per coil on AC operation, 5 watts per coil on DC.

Specialty

Functional design flexibility is assured given the wide variety of available valve configurations. The listed accessories enable the user to customize MB Series valves as 2-way normally open or normally closed by plugging one port; 3-way normally open, normally closed or directional control.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Compatible Fluids
Lubricated air, non-lubricated air, and inert gases compatible with materials of construction.

Standard Materials of Construction
- Body—plastic
- Seals—NBR
- Sleeve—stainless steel (305)
- Plunger—stainless steel (430FR)
- Stop—stainless steel (430FR)
- Spring—stainless (17-7PH)
- Shading ring—copper (AC valves only)
- Manifold base—zinc

Operating Speed
- Up to 1000 cycles per minute

Coil Classification
- Class A Taped, leaded coil standard

Response Time (approximate):
AC: 3-12 ms to open
5-16 ms to close
DC: 8-14 ms to open
5-15 ms to close

Electrical Characteristics:

Voltages
- AC—24/60, 120/60, 240/60
- DC—12, 24 &120

Power Consumption
- 4 watts AC per coil
- 5 watts DC per coil

Maximum allowable internal seat leakage is 3 SCCM @125 psi.

No allowable external leakage.

Ordering Instructions for Multiple Station Manifolds

Step 1: Determine the number of valve stations required. This will equal the number of subbase valves to order (MBD005).

Step 2: Select the combination of two and three-station manifolds that sum to equal the number of valve stations required (i.e. five stations total = one three-station and one two-station manifold).

Step 3: Choose the accessory kits required to complete the system and determine if you want the valves assembled to the manifolds at the factory.

Step 4: Specify the required voltage.

Example:

1. You have selected a valve which is to be manifolded.
2. Your system requires a five-station manifold (i.e. one three-station manifold attached to one two-station manifold).
3. You require the manifold bases and an interface kit. You decide to assemble the valves and manifolds. If they were to be assembled by the factory, there would be a price-add.
4. Your system is 120/60 watts AC: Your order should read:
   5-MBD005, 120/60
   1-MB-60-S001
   1-MB-60-S002
   1-MB-60-S003
   1-MB-60-S005
   1-MB-60-S006

Fig. 1

Voltage	24/60*	120/60	240/60*	12VDC	24VDC
Coil Code	AB215A	AB619A	AB820A	DC116A	DC218A
Coil Part Number*	CMB2230N18	CMB2238N18	CMB2240N18	CMB2231N18	CMB2234N18

*When ordering a replacement coil, use Coil Part Number (not Coil Code)
Select the MB series pressure vessel number from above and follow with the coil/enclosure number based on voltage from Fig. 1. Example MBD005 for 120/60 becomes part number MBD005AB619A
*Not active - consult factory

2-Way Dry Operator

Direct Acting Valves
1/4" NPT & 3/8" Barb

General Description:

2-Way Dry Operator valves are specially designed for non-contaminating and corrosive applications. The valves assure absolute purity and inertness to corrosion when used with a broad range of fluids.

Dry Operator valves feature two basic construction innovations. The operator is physically isolated from the fluid by a diaphragm so only the seal and valve body come in contact with the fluid, and valve bodies of Noryl™ and Teflon™ provide the purity from contamination and resistance to corrosion many industries demand.

Installation
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Compatible Fluids
Fluids compatible with diaphragm and body materials. See fluid compatibility chart in Technical Section of this catalog.

Specialty

Applications:

- Medical & Dental Equipment
- Chemical Dispensing
- Photo processing
- Instrumentation
- Hydroponics “nutrient dispensing”
- Food and beverage equipment

Mechanical Characteristics:

Standard Materials of Construction
- Body — Noryl™, Teflon™ (PTFE), Stainless Steel (303)
- Seals — PTFE and FKM as listed
- Sleeve Tube — Stainless Steel (304)
- Plunger — Stainless Steel (430FR)
- Stop — Stainless Steel (430FR)
- Springs — Stainless Steel (18-8)
- Shading Ring — Copper

Electrical Characteristics:

Agency Approvals
- UL and CSA approvals are available on valves with applicable coil/enclosure combinations.

Voltages
- AC — 24/60
  120/60–110/50
  240/60–220/50
- DC — 12, 24 & 120

(consult factory for other voltages)

Maximum Ambient Temperature
150°F

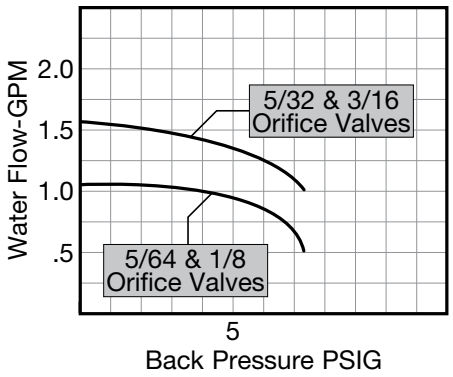
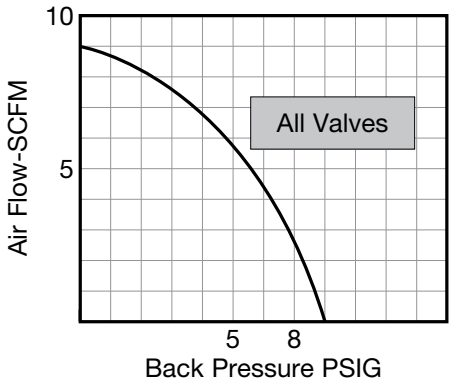
Important Application Information On Back Pressure Data

Dry operator valves require consideration of back pressure since the back pressure acts on a large area of the diaphragm. Excessive back pressure can keep the valves open on de-energization. The back pressure a standard valve can operate against depends on the orifice size, pressure differential and whether the media is a gas or liquid.

The following two charts provide a method to verify that the valve selected can meet the application back pressure requirements.

For applications involving back pressure that cannot be handled by catalog valves, please consult Parker Fluid Control Division.





Helpful Application Suggestions:

To keep the back pressure to a minimum, the downstream line should be as short as possible and be of the largest practical size. All restricting or flow controlling elements should be installed upstream.

Use of Back Pressure Charts:

To use the charts, it is necessary to know the flow and back pressure.

1. First calculate the flow in GPM for liquids or SCFM for gases from the flow charts in the Technical Information Section.
2. The back pressure is the downstream pressure in the system. A catalog valve may be used if the intersection of flow and back pressure is below the curve for its orifice size.

2-Way Hot Water and Steam

Direct Acting & Pilot Operated Valves
1/4" - 1 1/2" NPT

General Description:

2-Way Hot Water and Steam valves are specifically designed to withstand harsh application conditions. Many designs include integral stainless steel main and pilot orifices.

Installation
Valves should be mounted vertical and upright.

Standard Materials of Construction
Please refer to page D33.

Compatible Fluids
Ideal for the control of hot water and steam in a variety of applications.

Specialty

Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory

Coil Classification:
Class F Standard
Class H Standard for media temperatures over 297°F

Note: Magnalatch coils are not available on steam valves.

Agency Approvals:
Standard valves with NEMA 4X or explosion psolenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

Maximum Ambient Temperature
150° F

Please refer to Page D33 for details.

Applications:

- Industrial laundry machines
- Industrial dish washing machines
- Institutional cooking and food warming equipment
- Steam tables, steam cookers/kettles
- Sterilizers
- Dry cleaning equipment and steam irons
- Hospital equipment
- Steam presses
- Steam baths
- Autoclaves

*** High pressure steam valves require Class 'H' coils only from referenced coil chart.**

**** Models xxS5xx have an integral stainless steel main orifice seat.**
Models 72218xxx & 7221Gxxx are direct lift and will open at zero pressure differential but not at full flow.

***** Valves with EPDM (Ethylene Propylene) elastomers are limited to pressure range shown (45 or 50 psi) AND temperature rating shown (293-300° F). Do not use on higher pressure steam with pressure reducing valve; this may result in superheated steam.**

Intrinsically Safe Series

2-way, 3-way and 4-way Valves

General Description:

For hazardous and low-power power applications

Today, intrinsically safe systems and products are recommended, or in some cases compulsory, where the highest level of protection from explosion is required. They are also employed in applications that require low power.

A hazardous (classified) location is where fire or explosion hazards exist due to the presence of flammable gases or vapors, flammable liquids, combustible dust, or easily ignitable fibers or flyings.

Parker Fluid Control Division (FCD) has long served industry with innovative and safety related products. Our Intrinsically Safe solenoid valves have approvals for use in the United States and Canada in hazardous classifications for Classes I, II, III, Division 1 and 2, and in the United Kingdom for Division 0, 1 and 2. In Europe our valves are approved according to ATEX standards. All countries in Western Europe now follow common (ATEX) standards. All ATEX member countries should recognize apparatus which have been tested and certified by any ATEX member country.

What is an intrinsically safe system?
An intrinsically safe system is most often an assembly of approved intrinsically safe apparatus, associated apparatus, and interconnecting cables. Approved I.S. apparatus are devices that are incapable, during normal operation or under fault conditions, of causing explosive atmospheres to ignite by spark or thermal effect. Explosive atmospheres are mixtures of flammable or combustible material in air in ignitable concentrations.

Solenoid valves are examples of I.S. apparatus and must be approved for use in specific hazardous (classified) locations. Associated apparatus, such as safety barriers, are devices which affect the energy in the I.S. circuit and are relied upon to maintain intrinsic safety.

How does intrinsic safety apply to solenoid valves?
When related to solenoid valves, intrinsic safety means that the coil's current draw and resulting temperature is held to such a low level (by an approved safety barrier) that the valve no longer has the capability of igniting a mixture of flammable or combustible material, either during normal operation or under fault conditions.

When designed into an intrinsically safe system, FCD's Intrinsically Safe solenoid valves provide a number of significant performance advantages.

Low Power Consumption
FCD's Intrinsically Safe valves are rated at 24 VDC nominal, and are calibrated to operate at a minimum current draw as low as 29 milliamps (0.029 amps).

Low Temperature Rise
FCD Intrinsically Safe valve enclosures are designed to maintain a maximum outside surface temperature of less than 85°C. This meets the T6 classification assigned by Underwriters Laboratories Inc.

Variety of Mounting Possibilities
FCD Intrinsically Safe valves can be mounted in any position and still operate normally.

Media Compatibility
Intrinsically Safe FCD valves in 2-way constructions are suitable for use with oil, air, water, and inert gases. Our 3- and 4-way valves are suitable for use with air and inert gases only.

Watertight Construction
All Intrinsically Safe FCD coil enclosures are equivalent to NEMA Type 4X Watertight construction.

Note: See chart on page D51 for the allowable valve/coil combinations.

Intrinsically Safe

2-Way Direct Acting & Pilot Operated Valves

Mechanical Characteristics:

Standard Materials of Construction

- Body—Brass
- Seals—FKM, NBR
- Compatible Media
- Air, Inert Gas, Water and Lt. Oil (300 SSU)

Electrical Characteristics:

Based on coil selected. View the following coil and enclosure pages for detailed electrical information.

Miscellaneous:

For applications below 32°F, valves must be degreased. Consult Fluid Control Division prior to ordering.

Intrinsically Safe

Coil and Enclosure Information

Important: The intrinsically safe supply circuit should have enough capacity in all environmental and system conditions to insure delivery of at least the minimum specified operating current of the coil. Be sure to include the internal coil resistance and the bridge rectifier resistance (where applicable) when calculating circuit parameters.

Splice Box Enclosure with Strain Relief Egress Specifications:

Protection Class
- IP 65 according to DIN 40050 and IEC 529 standards. Equivalent to NEMA 4 Watertight.

Construction
- Polyamid with fiberglass enclosure and cover.

Electrical Entry and Connections
- Cable entry through a blue cable gland M20 X 1.5. Screw terminals for leads 3 x 1.5mm. Additional ground connection possible with external screw terminal.

Enclosure
- Coil, printed circuit and other parts for I.S. specifications are completely encapsulated within the enclosure using epoxy material.

Dielectric Strength
- Greater than 500 V rms

Bridge Rectifier Resistance
- Less than 50 ohms at 29mA

Coil Internal Resistance
- 295 ohms at 20°C

Voltage
- 24 VDC nominal

Minimum Operating Current
- 29 milliamps

Coil Temperature Rise
- Less than 5°C

Maximum Enclosure Temperature
- <85°C (corresponding to T6 class) according to ATEX.

Ambient Temperature
- -13°F to + 149°F (-25°C to +65°C)

F.M. Entity Parameters
- Vmax = 30 volts
- Imax = 100 mA
- Ci = 0
- Li = 0 mH

Options
- 1/2" NPT Conduit Hub Adaptor. Order part number U22-001.

Coil and Enclosure Information

Potted Lead Wire Coil with Strain Relief Egress Specifications

Protection Class
- IP 67 according to DIN 40050 and IEC 529 standards. Equivalent to NEMA 4 Watertight.

Construction
- Epoxy coated metal enclosure and cover.

Electrical Entry and Connections
- Fixed and potted two core (2 x 1mm^2) blue connection cable of 2m length. Other cable lengths on request. Entry cable gland pg 11 (18.6mm) (DIN 46320). Additional ground connection possible with external screw terminal.

Enclosure
- Coil, welded lead connections, printed circuit and other parts for I.S. specifications are completely encapsulated within the enclosure using epoxy material.

Dielectric Strength
- Greater than 500 V rms

Bridge Rectifier Resistance
- Less than 50 ohms at 29mA

Coil Internal Resistance
- 295 ohms at 20°C

Voltage

Coil and Enclosure Information

Splice Box Enclosure with Booster Circuit and Strain Relief Egress Specifications

Protection Class

- IP 65 according to DIN 40050 and IEC 529 standards. Equivalent to NEMA 4 Watertight.

Construction

- Polyamid with fiberglass enclosure and cover.

Electrical Entry and Connections

- Screw terminals within terminal box. Cable connection through M20x1.5 cable gland. Additional ground connection possible with external ground terminal.

Enclosure

- Coil, printed circuit and other parts for I.S. specifications are completely encapsulated within the enclosure using epoxy material.

Booster Circuits

- The electronic booster circuit consists of capacitor, diodes, thyristor and Zener diode.

Voltage

- Nominal: 24 VDC nominal
- Maximum: 28 VDC
- Minimum at Attraction: 21.6 VDC Circuit design must ensure that at least 21.6 VDC is available at the solenoid for proper operation.

Minimum Holding Current

- 60 mA

Coil Temperature Rise

- Less than 5°C

Maximum Enclosure Temperature

- <85°C (corresponding to T6 class) according to ATEX.

Ambient Temperature

- 13°F to + 140°F (-25°C to +60°C)

Required Time Delay for Renewed Valve Actuation after Booster Discharge

- Approximately 1-3 seconds at nominal voltage

Duty Cycle

- 100% solenoid duty

Options

- 1/2" NPT Conduit Hub Adaptor. Order part number U22-001.

3-Way Manual Reset

Direct Acting & Pilot Operated Valves

General Description:

3-Way Manual Reset solenoid valves are designed to start and stop the flow of media as the result of an electrical signal. This can be a problem in some power outage situations were the valve must remain in the no voltage supplied position until the system is manually restarted. Manual reset valves have an added safety device to address this issue. When the manual reset device is triggered, the valve remains in the at rest position until the reset mechanism is manually latched.

Pilot operated versions require minimum operating pressure differential for proper operation.

Installation:
Valves can be mounted in any position.

Specialty

Mechanical Characteristics:

Standard Materials of Construction
- Body — brass or stainless steel (430)
- Seals — NBR or FKM seals as listed
- Sleeve tube — stainless steel (303 or 304)
- Plunger — stainless steel (430FR)
- Shading ring — copper
- Stop — stainless steel (430FR)
- Springs — stainless steel (18-8)
- Pilot orifice — stainless steel (303)

Compatible Fluids
- Depending on the valve used, most common media including air, inert gases or petroleum products.
- Hydraulic Fluids

Electrical Characteristics:

Voltages
- AC — 120/60–110/50
  240/60–220/50
- DC — 12, 24 & 120

Power Consumption
- 10, 22 watts

Agency Approvals
- cUL listed.

Maximum Ambient Temperature
149°F

Applications:
- Pilot control on process valves
- Fluid “circuit breakers” requiring manual intervention to reset after being tripped (safety feature).

Principles of Operation

No Voltage release models

3-Way Normally Closed Valves

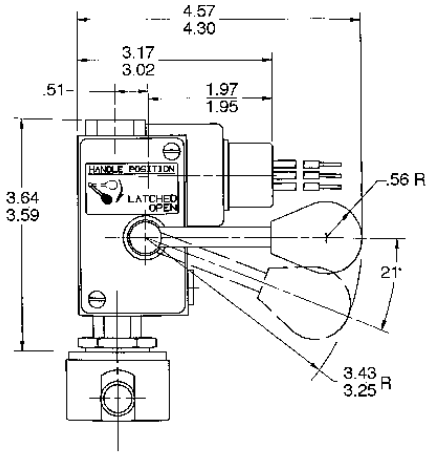
These valve types can only be actuated (opened) when the coil is energized and the hand lever is manually moved downward to the latched valve-open position. If the coil is not energized, the mechanism will not become latched in this position, as soon as the hand lever is released, it will return to the unlatched valve-closed position. The hand lever mechanism can only be engaged when the coil is energized. When the solenoid coil is de-energized, the handle and the mechanism are automatically tripped at the valve is returned to its original normally closed, unlatched position.

3-way Normally Open Valves

The principles of operation for normally open valves are identical to the normally closed version except the valve's de-energized position is normally open.

Valve Reference D51

3-Way Normally Closed



Dimensions apply to Manual Reset feature only.

Dimension	No-Voltage Release	Electrically Tripped

2-Way & 3-Way Hydraulic

Direct Acting Valves
1/8" NPT

General Description:

2-Way & 3-Way hydraulic direct acting valves are specifically designed for use in hydraulic systems. These valves are spool type valves that can withstand a static pressure up to 3000 PSI. All internal parts are compatible with most hydraulic fluids.

Installation
Valves can be mounted in any position. Preferred orientation is with the coil vertical and upright.

Standard Materials of Construction
- Body—Stainless Steel (430F)
- Seals—Metal
- Flange Seal—NBR
- Sleeve Tube—Stainless Steel (304)
- Plunger—Stainless Steel (430FR)
- Stop—Stainless Steel (430FR)
- Springs—Stainless Steel (18-8)
- Shading Ring—Copper
- Spool—Stainless Steel (17-4PH)

Compatible Fluids
- Hydraulic Fluids

Specialty

Electrical Characteristics:

Voltages
- AC—24/60
  120/60–110/50
  240/60–220/50
- DC—12, 24 & 120

Power Consumption
- 10, 14, 21 watts

Coil Classification
- Class F Standard
- Class H available (71211, 71221, 71331)
- Class B Coils Standard on (A11, A12, A13, A15, A16)

Agency Approvals
- UL and CSA approvals are available on valves with applicable coil/enclosure combinations. (Models 71211, 71221 and 71331 only)
- Models A11, A12, A13, A15 & A16 do not carry any agency approvals

Maximum Ambient Temperature
- 185°F

Maximum Allowable Leakage
- Maximum Allowable Internal Seat Leakage at 70° F with MIL-H-5606 oil is 80cc/min at 1000 PSI. (Models 71211, 71221 and 71331)
- Maximum Allowable Internal Seat Leakage at 70° F with MIL-H-5606 oil is 295cc/min at 3000 PSI. (Models A11, A12, A13, A15, A16)
- External — None (All models)

Applications:

- Hydraulic Cylinders
- Lift Trucks
- Machine Tools
- Sky Cranes
- Hydraulic Door Openers

Coil Part Number*	AB720S24	AB728S24	AB731S24	A7724F24	A7727F24

*When ordering a replacement coil, use Coil Part Number (not Coil Code)

*Select the Series A pressure vessel model number as shown above and follow with the appropriate coil/enclosure part number based or required voltage from Fig. 1
Example A15LB13002 for 120/60 becomes part number A15LB13002AB6A46
Example A166LB13001 for 12VDC becomes part number A166LB13001DC1A22

Table 1:
3-Way High Pressure Hydraulic Valves (Series A)
Maximum Permissible Flow & Pressure Differentials

Valve Function	Flow Path	Maximum Pressure Differential (PSI)	Maximum Flow (GPM)
3-Way Normally Closed	Port 1 to Port 2	1000	5.7
	Port 2 to Port 3	1000	7.0
3-Way Normally Open	Port 3 to Port 2	3000	9.0
	Port 2 to Port 1	3000	8.5
3-Way Universal (Directional)	Port 2 to Port 3	2000	7.0
	Port 2 to Port 1	2000	7.0

Flow Limits
The spool in A10 Series valves will fail to shift when the flow exceeds the maximum rated value. Each catalog listing indicates the flow and pressure drop for which these valves will operate without malfunction.

The static pressure listed for each valve will not adversely affect valve operation as long as the rated flows and pressure differentials are not exceeded. The maximum flows (GPM) and pressure differentials (PSI) are based on Mil-H-5606A hydraulic oil at 80°F.

Response Times: AC = Approximately 4-8 ms to open or close
DC = Approximately 15-30 ms to open, 15-25 ms to close.
Operating Speed: Up to 300 cycles per minute

Magnelatch® Coil Option

Magnelatch® coil option eliminates power consumption and heat rise

General Description:

Solenoid valves are typically operated by an on/off coil that remains on, generates heat, and consumes power while operating. Power consumption can be a problem for continuous duty applications.

Parker Fluid Control Division offers a no power solution for your non-safety shut-off applications. This solution is the Magnelatch® coil option. This coil option is offered on the products in this section.

The Magnelatch® operator contains a permanent magnet that is shifted on (latched) or off (released) by a momentary electrical current pulse of approximately twenty milliseconds (.02 seconds).

The conventional solenoid valve is in one of two positions – off or de-energized, or on – energized. The Magnelatch® requires no continuous power thus the term latch position is used for on and release position for off. Valves with Magnelatch coils remain in their last energized position and do not return to their de-energized position in the event of a power outage.

Magnelatch coils are not available on valves for steam service.

Valves with Magnelatch coils have the same pressure rating as that valve with a 10 watt coil.

Specialty

Applications:

Instrumentation
No heat build up – eliminates constant calibrations and permits confinement and compactness.

Can be used with such sensors as thermistors and thermocouples.

Machine Tools
Operates with simple switches and eliminates holding relays and relayed circuitry required to sequence and position operations.

Remote Control Equipment
pulsing circuitry, low power consumption permit the use of Magnelatch® coils in many custom operations. Operation can be controlled by radio frequency or mechanical timer, etc.

Other Applications
- Medical equipment
- Transportation products
- Material handling equipment
- Solar panels
- Pilot valve on control valve (3-Way)
- Single acting Cylinder Actuation (3-way)
- Natural gas service

Wiring Circuits

Leads/Wires	Description
2	For use with standard duty DC power source

Pulse Coils - Current Draw

Latch	Release
12v DC Latch 2.10 amps.	Release 1.95 amps.

Pulse DC Operation

Minimum pulse for Latching is 10 milliseconds.
Minimum pulse for Releasing is 25 milliseconds.

Maximum “ON” time is 5 minutes with minimum “OFF” time 40 minutes. If the “ON” time is of a shorter duration, the “OFF” time would be shorter proportionally.

Dual-Flow Dispensing Valve

For the Fuel Dispensing Market

General Description:

Parker Fluid Control Division's Dual-Flow solenoid valves are designed to control two flow rates on command. The valves are actually two valves in one compact assembly using a single dual-wound coil.

The valves accurately dispense a predetermined amount of liquid by providing a high-flow (full-flow) for delivery of the bulk amount, and then switch to the low-flow mode to dispense the final amount required.

Installation:

Valves can be mounted in any position.

Specialty

Mechanical Characteristics:

Flow Sequence

Off-Low-High-Low-Off

Standard Materials of Construction:

- Body – Brass
- Seals – fluorocarbon (FKM)
- Sleeve – stainless steel
- Plunger – stainless steel (430 FR)
- Diaphragm – NBR
- Shading Ring – copper
- Springs – stainless steel

Enclosure

Explosion proof, 1/2" conduit, NEMA Type 7 (UL Class I, Groups C & D)

Electrical Characteristics:

Standard Voltages:

AC –120/60 110/50

DC & other voltages – consult factory

Power Consumption

- High flow - 15 watts
- Low flow - 8 watts

Agency Approvals

UL listed and CSA certified (ATEX and IECEx available upon request)

Coil Classification

Class F taped with 3 gasoline vapor resistant lead wires.

Applications:

- Fuel dispensing
  - Pre-pay
- Process industries (blending/mixing/batching)
  - Petrochemical
  - Refining
  - Food
  - Pharmaceutical

Maximum Ambient and Fluid Temperature

104°F

2-Way Normally Closed - XLG Fuel Dispensing - Brass

Fuel Selector Manifolds

6 Port Manifold with Manual Override and 5 PSI Check Valve

General Description:

Parker Fluid Control's Fuel Selector Valve Manifolds are designed for electrically controlled remote tank selection in application with multiple diesel fuel tanks.

Unique in design, the Fuel Selector Valve Manifold permits continuous engine function during tank switching from a safe and convenient location.

These innovative manifold solutions include 2-way, normally closed solenoid operators that are rated for fuel safety shut-off and feature a manual operator (standard) for system operation during a power outage.

Installation:
Valves can be mounted in any position.

Standard Materials of construction:
Body – Anodized Aluminum
Seals – Fluorocarbon (FKM)
Sleeve – 300 Series Stainless
Plunger/Stop – 430 FR
Stem – Stainless Steel

Electrical Characteristics:

Standard Voltages
DC - 12, 24

Coil Classification:
Class F standard (10 watt)

Maximum Ambient Temperature:
176° F

System Specifications:

- Six Port Diesel Manifolds
  - Four 2-Way normally closed operators ensure fuel shutoff and return flow.
  - 5 PSI (0.34 bar) check valve included with manifold to be installed between engine supply and return ports.

Applications:

- Marine/mobile applications
  - Multiple tank selection
  - Fuel polishing (marine)
- Power generation
  - Multiple tank selection

Mechanical Characteristics:

- Recommended Filtration: 150 micron (not included)
- Flow Capacity:
  - 180 GPH - 6 port diesel

	ENGLISH UNITS					METRIC UNITS

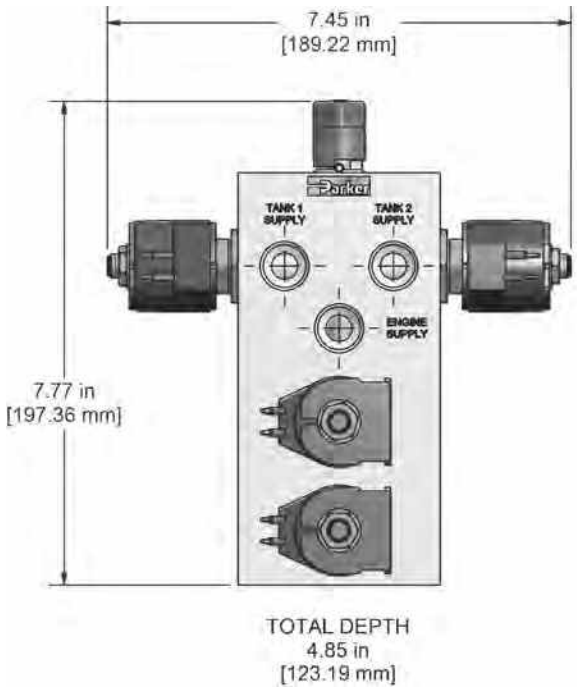
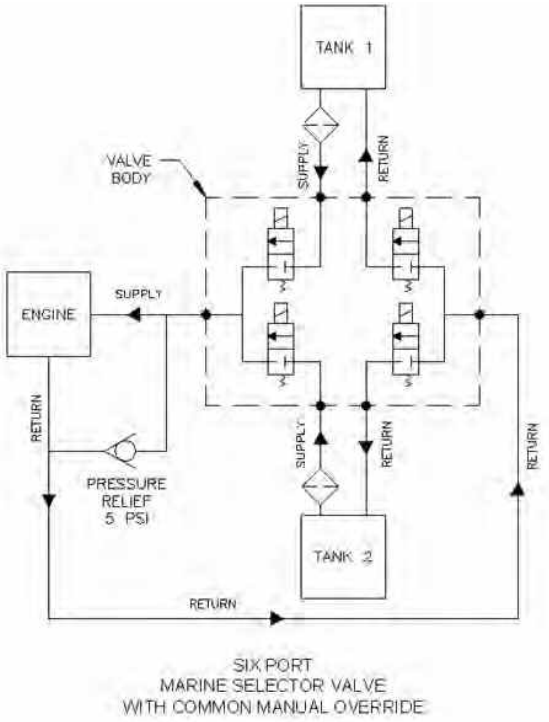
1/2	7/16	2.25	0	3	7121Z027F1J111xx	11.1	1.935	0	0.207

*In place of 'xx' in the part number, use 'C1' for 12VDC or 'C2' for 24VDC voltages.



Dimensional Drawings for the 6 port Fuel Selector Manifold



Schematic shows the ease of incorporating the Fuel Selector Manifold into your system

Maximum Ambient Temperature:
176°F
Per ABYC H23 (Diesel Fuel Systems)
and ABYC H-24 (Gasoline Fuel Systems)
Maximum Fluid Temperature:
71°C or 160°F
Current Draw: .83A each coil

Power Consumption: 10 watts each coil
Coil: Molded Class F coil with 18" leads
Electrical Enclosure: External Yoke
Body Material: Aluminum
Seal Material: FKM

For equivalent 3 port versions of the valve. For gasoline service, please contact Parker Hannifin Fluid Control Division @ 1800-VALVE05.

CNG Valve

High pressure and high flow valves
for compressed natural gas

General Description:

In an effort to be environmentally conscious, comply with government emission laws and decrease dependence on foreign oil, clean burning alterative fuels such as CNG (compressed natural gas) have become a viable solution. Parker Fluid Control Division is committed to providing system solutions for these and many other alternative fuel applications.

Parker Fluid Control Division is now pleased to offer the high pressure, high flow, low leakage CNG natural gas valve. This product is designed for integration into compressed natural gas fuel delivery systems (i.e. trucks, buses, & etc…) utilizing single and multi-tank applications.

Installation:
Valves can be mounted in any position. The preferred orientation is with the coil vertical and upright.

Standard Materials of Construction:
Body - Stainless steel (430F)
Seals - HNBR (7121Z033xxx)*
- Nylon (7121Z015xxx)
Plunger/Stop - Stainless steel (430F)
Spring - Stainless steel (17-7 PH)
Sleeve - Stainless steel (305)

*HNBR is a proprietary seal material

Electrical Characteristics:

Standard Voltages
DC - 12, 24

Coil Classification:
Class H standard

Maximum Ambient Temperature:
170° F

Current Drain:
- 1.6 amps (12VDC)
- 0.83 amps (24VDC)

Product Advantages:

- Valves range in flow for single and multi-tank systems
- Wide pressure range of 0-4500 PSI for working and maximum operating tank pressure
- Max Allowable Internal Seat Leakage
  - 7121Z033xxx - Bubble-tight from 0-4500 psi
  - 7121Z015xxx - <100 cc/min from 300-4500 psi

Note: Consult Factory for other CNG valves used in installations after the CNG is regulated to a much lower pressure.

Timer Drain Valves

For Compressed Air Systems

General Description:

Parker Fluid Control's Timer Drain Valves automatically eliminate condensate that has collected up in compressed air lines.

These timers can be used on a wide variety of our 2-way solenoid Normally Closed valves as well as 3-way valves for piloting our larger Angle Body control valve, using DIN 43650A / ISO 440 coils.

Timers are available to control both the duration and frequency of the valves energized period during which condensate is evacuated.

Installation:
Preferred orientation is with the coil vertical and upright.

Standard Materials of Construction:
Body – Brass
Seals – FKM
Plunger/Stop – Stainless steel (430F)
Sleeve – Stainless steel (304/305)
Springs – Stainless steel (18-8)
Shading Ring – Copper

Specialty

Electrical Characteristics:

Standard Voltages
AC –24-240/50-60Hz
DC –24-240 VDC

Coil Classification
Class F Standard
Class H Available

Agency Approvals
- UL listed and CSA certified
- Meets NEMA Type 4X requirements
- CE Certification

Maximum Ambient Temperature
- -23º F to 122°F for Timer
- See Product Page for Valve Temperature Range

Applications:
- Air Compressors
- Air Drying Systems
- Refrigerated Dryer Systems

Key Features:
- Selectable Timer Ranges for duration and frequency to precisely match contaminant load
  – 0.5 - 10 seconds ON
  – 0.5 - 45 minutes OFF
- Integral Strainer available to prevent contaminant from affecting valve operation
- Manual reset & test button
- LED's to indicate operation
- Rated for Continuous Duty

Coil Reference

Coil Portfolio and Solenoid Enclosures (Integrated Modular Coils and Replacement Coils for Non-integrated)

General Description:

Solenoid Enclosure and Coil Information

Coils are electrical devices that produce magnetic flux when electrical power is applied to the windings. Surrounding the coil is the metal solenoid enclosure and frame. Together with the plunger and stop, it forms the magnetic circuit that operates the valve. Without the enclosure, the magnetic circuit is not complete. Without a complete magnetic circuit, the magnetic field is reduced and valve performance suffers. Depending on the coil voltage and power rating, the pressure rating of the valve can vary.

Solenoid enclosures come in a variety of constructions offering varying levels of protection against the elements and other forces. NEMA identifies the different enclosures as “Types” and NEC sets standards for their safety and performance.

Integrated coils have an epoxy or thermoplastic "over-molding" creating a one-piece coil/enclosure for modularity and protection from the environment.

The National Electrical Manufacturers Association (NEMA) recommends suitable materials and components to meet each enclosure type. The enclosures listed here will only meet the applicable NEMA recommendations when properly installed and operated to NEMA specifications and in accordance with the NEC.

Electrical Characteristics:

Standard Voltages:

AC –24/60
120/60 110/50
240/60 220/50
DC –12, 24 &120
For other Voltages – Consult Factory

Coil Classification:

Class F Standard
Class H Available

Agency Approvals:

Standard valves with NEMA Type 4X or Explosion Proof solenoid enclosures are UL Listed and CSA Certified. DIN coils are UL Recognized. For additional details, consult factory.

Optional coils feature ATEX and IECEx Approvals.

Ultra Low Power Coils (Coil Chart 12) are used on valves with a unique solenoid operator designed to keep current draw to a minimum, thus achieving the extremely low power consumption of 0.6 watts with no refresh time required for subsequent energization. These valves are ideally suited for use in automated control systems, applications where minimizing energy consumption is critical or where heat rise in the coil must be kept to a minimum. Due to the low power consumption, an increased number of solenoid valves can be driven from the same power source, reducing the overall installation cost.

Electrical Accessories for Charts 7-8

Various electrical accessories are available with 7000 series integrated coils. These accessories are available as individual pieces; see chart. To order a coil with the accessory attached, write the electrical option code in place of the last two digits of the coil code.

Coil Option Picture	Accessory Part #	Coil Option Code	Description	Coil Types	Coil Codes
	ELECD1	D1*	Cable Gland DIN Plug	DIN	D1D1, D2D1, D3D1
	ELECD2	D2*	1/2" Conduit DIN Plug	DIN	D1D2, D2D1, D3D2

* The plug comes complete with gasket.

Electrical Accessories for Charts 7-8

Option Picture	Option Code	Description	Coil Codes
	A0	Standard Connection, 7/8" knockout to accommodate strain relief, adapter or fittings for lead wires, NEMA Type 2	J111, J222,J322, F611, J611
	B0	1/2" Conduit Connection for attachment of conduit, 1/2" NPT fittings or BX cable, NEMA Type 2	F611, J611
	F0	Yoke for use where open enclosure is suitable (Does not carry any NEMA Type approvals)	F611, J611
	G0	Watertight, 1/2" conduit hub accommodating 1/2" NPT fittings or BX cable, NEMA Type 4x	F611, J611
	J0	Splice box, 7/8" knockout allowing for internal splice, NEMA Type 2	J111, J222, J322, F611,J611
	N0	Nut and Washer	All Integrated Coils

^ Meets NEMA 4, 4x when connected to a screw terminal or DIN Coil, as applicable. It is provided with a 1/2" NPT conduit thread and ground screw.

International Electrotechnical Commission

About the IECEx

IECEx System Objective
The objective of the IECEx System is to facilitate international trade in equipment and services for use in explosive atmospheres, while maintaining the required level of safety:

- reduced testing and certification costs to manufacturer
- reduced time to market
- international confidence in the product assessment process
- one international database listing
- maintaining International Confidence in equipment and services covered by IECEx Certification

What is an Ex area?
Ex areas can be known by different names such as “Hazardous Locations”, “Hazardous Areas” “Explosive Atmospheres”, and the like and relate to areas where flammable liquids, vapours, gases or combustible dusts are likely to occur in quantities sufficient to cause a fire or explosion.

The modern day automation of industry has meant an increased need to use equipment in Ex areas. Such equipment is termed “Ex equipment”

1. The IECEx Certified Equipment Scheme
This IECEx Scheme is an International Certification Scheme covering product that meets the requirements of International Standards, e.g. IEC Standards prepared by TC 31.

The IECEx Certified Equipment Scheme provides both:

a) A single International Certificate of Conformity that requires manufacturers to successfully complete:-

- Testing and Assessment of samples for compliance with Standards
- Assessment and auditing of manufacturers premises
- On-going surveillance audits of manufacturers premises

or

b) A “fast-track” process for countries where regulations still require the issuing of national Ex Certificates or approval. This is achieved by way of global acceptance of IECEx equipment Test and Assessment Reports.

3. The Ex Mark of Conformity System
This IECEx System is an International Conformity System where a Mark of Conformity will be granted by approved IECEx certifiers (ExCBs) located in IECEx participating countries for equipment that is covered by an IECEx Certificate of Conformity and hence has been tested and manufactured under systems that are under ongoing surveillance by ExCBs.

It will help governments, safety regulators, and industry to have greater assurance that the equipment being operated or supplied for use in areas where flammable gases and vapours and combustible dusts (termed explosive atmospheres) are present, meet the world’s most respected and vigorous safety standards.

The Mark shall only be placed on products or on packaging and promotional material covered by a valid IECEx Certificate of Conformity issued in accordance with the IECEx System rules.

4. IECEx Certified Persons Scheme
This IECEx Scheme is an International Conformity Scheme that provides the global Ex industries with a single system for the assessment and qualification of persons meeting the competency prerequisites needed to properly implement the safety requirements based on the suite of IEC International Standards covering explosive atmospheres, e.g. the IEC 60079 series of standards.

The Certified Persons Scheme provides the international Ex industries with a qualification system that is transportable across borders.

IECEX Worldwide Member Countries

Definitions (ref. IEC 60079-10)

2.1 Explosive gas environments
Mixture with air, under atmospheric conditions, of flammable substances in the form of gases, vapor, mists or dusts in which, after combustion has occurred, combustion spreads to the entire unburned mixture.

2.2 Hazardous areas
A hazardous area is an area in which an explosive gas environment is present, or may be expected to be present, in quantities such as to require special precautions for construction, installation and use of electrical apparatus.

2.3. Ingredients for an explosion
When combustible materials are mixed with air, an explosive mixture is produced. Danger of explosion therefore exists wherever these hazardous materials are handled: such a condition is to be found on the biggest chemical plant as well as at the smallest filling station.

Nowadays with the use of electronic and electrical instrumentation in process control, the risk of combustion by electrical energy has increased sharply.

To protect personnel and expensive equipment special precautions should be taken to prevent combustion of those dangerous substances. Conditions likely to ignite explosive mixtures are as follows:

- Electrical sparks and arcs produced when circuits are opened and closed (e.g. relay contacts)
- Conductors heated by passage of current or by faulty apparatus.
- Mechanical sparks; moving object hitting stationary object.
- Electrostatic sparks caused by charged components.
- Chemical action.
- Lightning strikes.
- Radio waves

2.4 Zones
The hazardous areas are classified in zones based on the frequency of the occurrence and the duration of an explosive gas environment as follows:

- Zone 0

An area in which an explosive gas environment is present continuously or is present for long periods Type of protection: ia - intrinsic Safety

- Zone 1

An area in which an explosive gas environment is likely to occur in normal operations. Type of protection: d - flameproof enclosure, e - increased safety, ib - intrinsic safety, m - encapsulation

- Zone 2

An area in which an explosive gas environment is not likely to occur and if it does occur it will exist for a short period only. Type of protection: n - protection (IEC 60079-15)

ATEX/IECEx General Information

Parker Fluid Control Division is pleased to announce the addition of several new ATEX coils designed for explosive atmospheres to comply with European directive 2014/34/EU and standards IEC / EN 60079 for gases and for dust. Coil marking complies with the updated standards. Declaration of Conformity documents for specific part numbers are provided with the electrical product and also provided upon request.

Background:

The ATEX directive is a European initiative undertaken to ensure the safety of products used in potentially explosive atmospheres. It is a European mandate that all products that could provide ignition to a potentially explosive atmosphere be produced to specific requirements, under controlled conditions, by a manufacturer certified compliant to the directive by an independent notification body. Certification requires approval of the entire quality management system to the requirements of ISO 9001 with additional requirements imposed for product verifications, testing and records thereof.

The International Electrotechnical Commission (IEC) is the global organization overseeing the development of international standards for electrical, electronic & related technologies. The IECEx scheme provides a means of International Certification for manufacturers of electrical equipment intended for explosive atmospheres thereby eliminating the need for multiple national certifications in all participating countries. Any recognized certified body can provide a product Certificate of Conformity stating the product design conforms to the relevant IEC standards and the product is manufactured under a quality plan assessed by an accepted certification body. The IECEx scheme is adopting the ATEX principles and this scheme is becoming internationally accepted.

Within North America, UL, FM, and Intertek are the accepted certification bodies (EXCB) and EX assessment & testing labs (EXTL)under the IECEx scheme. The United States has recently integrated both the zone and division system requirements into their respective installation codes. Specifically for the U.S., the National Electric Code Article 505 (NEC).

The Canadian Standards Association (CSA) has implemented the IEC system. All new installations follow the three-zone area classification while following the two-division system for existing facilities.

The introduction of zones area classifications in North America as an accepted alternative to divisions sees the introduction of the IECEx scheme and its continued acceptance on a global basis.

The European ATEX and global IECEx standards apply to hazardous environments from intrinsically safe apparatus to flameproof control systems to increased safety requirements.

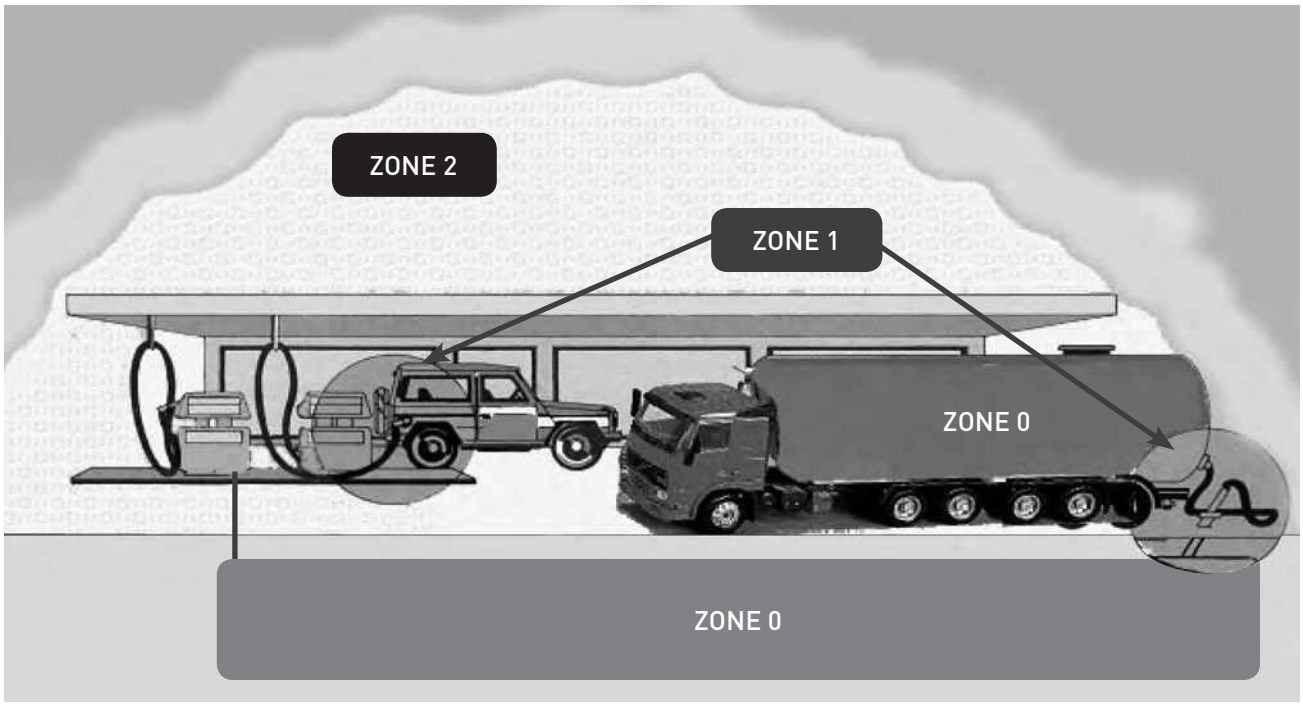
Classification of Hazardous Location

Explosive Environment	Continuous Presence	Intermittent Presence (normal operation conditions)	Occasional Presence (abnormal operation)
IEC	Zone 0 (gas) Zone 20 (dust)	Zone 1 (gas) Zone 21 (dust)	Zone 2 (gas) Zone 22 (dust)
Europe	Zone 0 (gas) Zone 20 (dust)	Zone 1 (gas) Zone 21 (dust)	Zone 2 (gas) Zone 22 (dust)
Canada (CEC)* **USA (NEC)****	CI. I Div.1 (gas) CI. II Div.1 (dust) CI. III Div.1 (fibres)	CI. I Div.1 (gas) CI. II Div.1 (dust) CI. III Div.1 (fibres)	CI. I Div. 2 (gas) CI. II Div. 2 (dust) CI. III Div. 2 (fibres)

* (CEC): Code Canadian d'Electricite ** (NEC): National Electrical Code

Example of Zones Division:



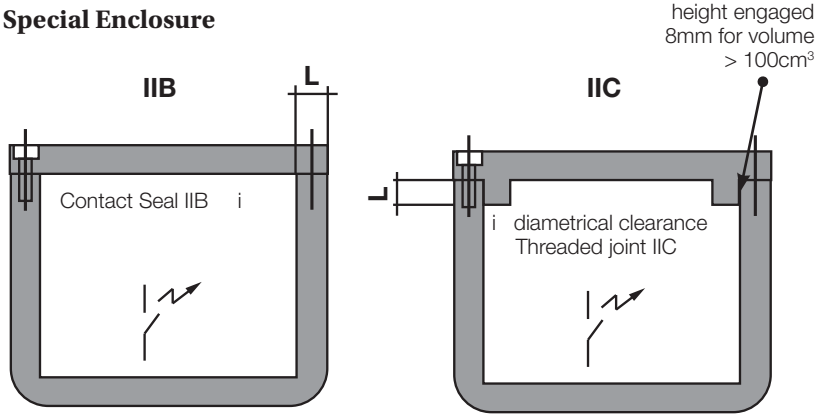
5 Types of Protection used by Parker

5.1 Flameproof enclosure

"d"

A type of protection where the parts that can ignite an explosive environment are placed in an enclosure which can withstand the pressure developed during an internal explosion of an explosive mixture and which prevents the transmission of the explosion to the explosive environment surrounding the enclosure.

Special Enclosure



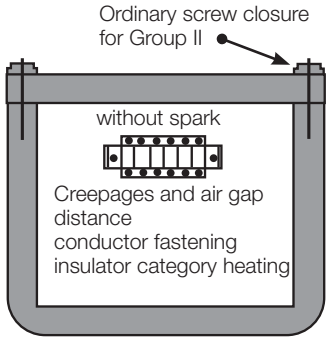
For volume > 2 dm³
Mini lenght L = 12.5 mm
Max gap i = 0.15 mm

For volume > 2 dm³
Mini lenght L = 25 mm
Max dia. clearance i = 0.15 mm

5.2 Increased Safety

"e"

Type of protection applied to electrical apparatus that does not produce arcs or sparks in normal service, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

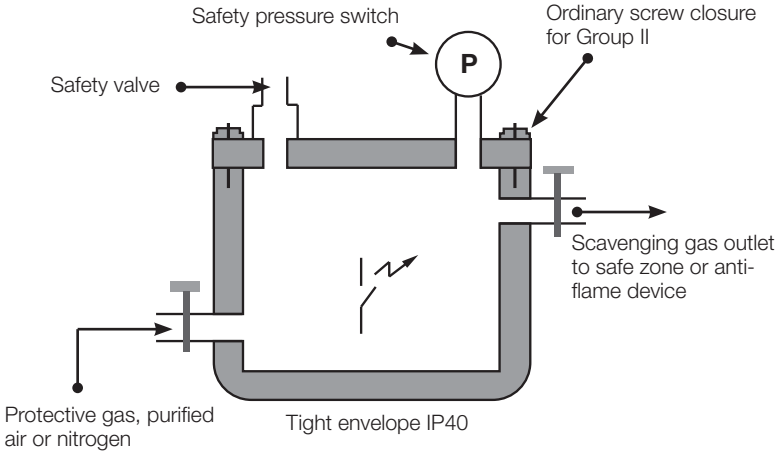


Tight envelope IP54

5.3 Pressurized Apparatus

"p"

A type of protection by which the entry of a surrounding environment into the enclosure of the electrical apparatus, is prevented by maintaining, inside the said enclosure, a protective gas at a higher pressure than that of the surrounding environment. The overpressure is maintained either with or without a continuous flow of the protective gas.



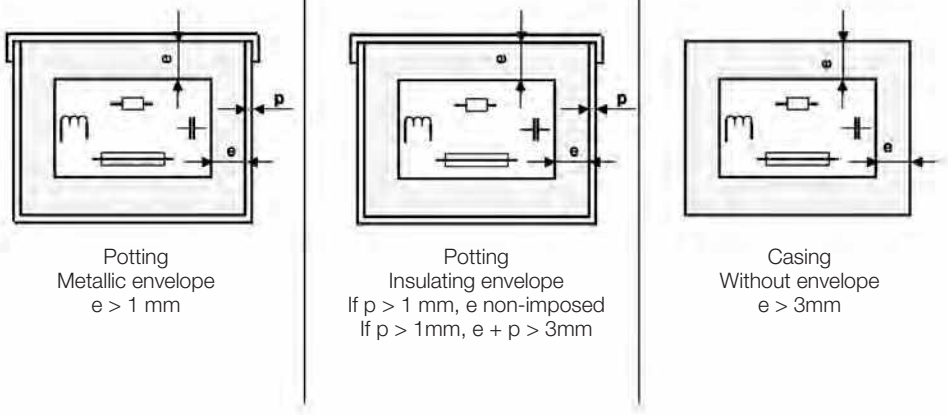
Tight envelope IP40

Parker Hannifin Corporation
Fluid Control Division
1 800 825 8305 (1 800 Valve05)
www.parker.com/fcd

5.4 Encapsulation

"m"

A type of protection in which the parts which could ignite an explosive environment by either sparking or heating are enclosed in a compound in such a way that this explosive environment cannot be ignited. (IEC60079-18)



Potting
Metallic envelope
e > 1 mm

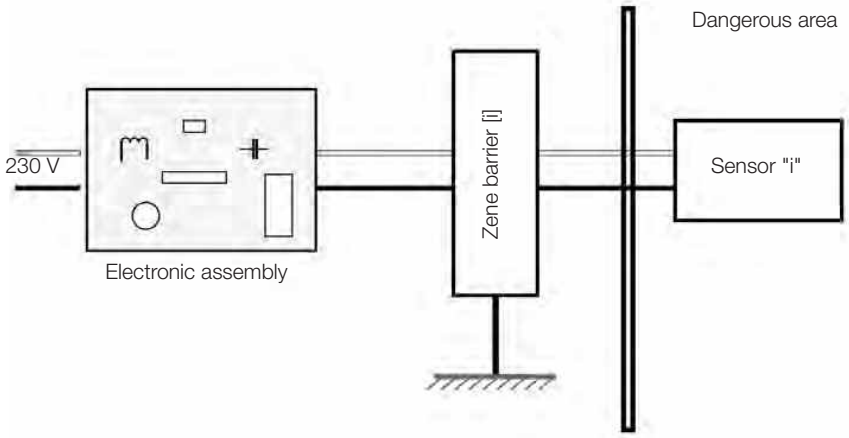
Potting
Insulating envelope
If p > 1 mm, e non-imposed
If p > 1mm, e + p > 3mm

Casing
Without envelope
e > 3mm

5.5 Intrinsic Safety

"i"

A circuit in which no spark or any thermal effect produced in the test conditions prescribed in the standard IEC60079-11 (which include normal operation and specified fault conditions) is capable of causing combustion of a given explosive environment.



Coil "T" Ratings

Temperature Classification	Maximum Allowable Surface Temperature	
	°C	°F
T1	450	842
T2	300	572
T3	200	392
T4	135	275
T5	100	212
T6	85	185

Product Features

- Space saving approach
- Less manifold machining means lower manifold cost
- Cartridge valves are 100% tested 'C4' and 'C5' 1/2" NPT coils have a rotating conduit hub for easier installation
- No loose parts: sleeve, plunger, spring, orifice are pressed to gether as one unit
- Available with all coils/enclosures from Chart 9 above

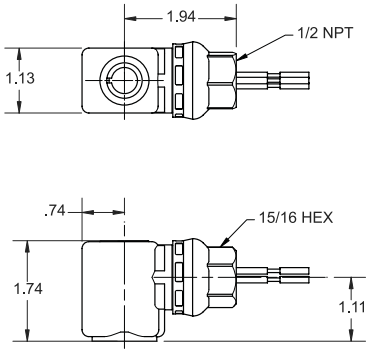
Coil Information

Encapsulated Watertight Designs. Available as Modular Coils or for Fully Assembled Valves.

Conduit Coil
Coil Code: C4*

Construction:
- Class F
- 18" lead wires
- Ground wire
- 1/2" NPT conduit hub
- NEMA 4X, IP65 protection

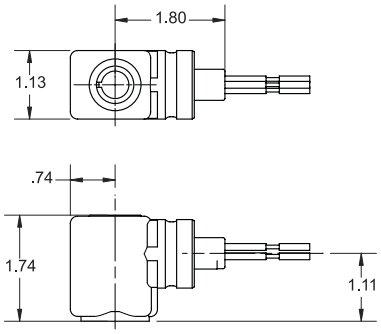
AC: 10 Watts ***except*** *2 Way*
Normally Closed is 8.5 Watts
DC: 8 Watts



Leaded Coil
Coil Code: B4*

Construction:
- Class F
- 18" lead wires
- Ground wire

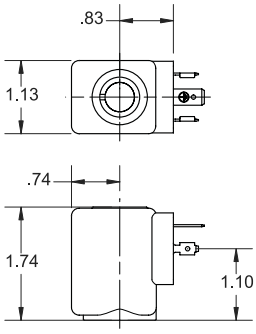
AC: 10 Watts ***except*** *2 Way*
Normally Closed is 8.5 Watts
DC: 8 Watts



DIN Coil
Coil Code: D6*

Construction:
- Class H
- DIN 43650A/ISO 4400 con guration
- NEMA 4X, IP65 protection with a suitable plug and gasket

AC: 10 Watts ***except*** *2 Way*
Normally Closed is 8.5 Watts
DC: 8 Watts



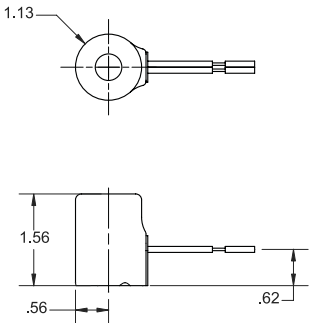
Coil Information

Conventional Coil & Enclosures for Fully Assembled Valves Only

Grommet Coil
Coil Code: B2*

Construction:
- Grommet enclosure
- Taped wrapped coil
- Class F
- 18" leads- 2 wire

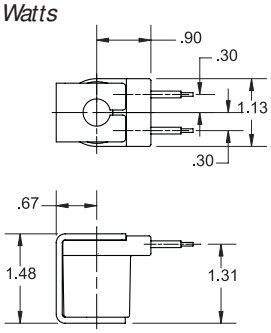
AC: 7 Watts
DC: 8 Watts



Leaded Coil
Coil Code: L2*

Construction:
- Open frame enclosure
- Molded leaded coil
- Class F
- 18" leads- 2 wire

AC: 10 Watts ***except*** *2 Way*
Normally Closed is 8.5 Watts
DC: 8 Watts



Tab Coil
Coil Code: T2*

Construction:
- Open frame enclosure
- 1/4" tab terminals
- Class F

AC: 10 Watts ***except*** *2 Way*
Normally Closed is 8.5 Watts
DC: 8 Watts

General Data-Solenoid Coils

Power and Voltage
All coils used in Parker FCD solenoid valves are designed for continuous duty except where noted. On AC, inrush current occurs at the moment the solenoid is energized. The continuous current after inrush is holding current. Typical AC current values are shown to the right. DC solenoids have no inrush. Typical amp ratings for DC are determined by dividing DC watts by DC voltage. All Parker FCD solenoid valves are tested to operate at 15% under-voltage and full pressure ratings. AC and DC voltage ratings (nominal) and normal operating ranges, as shown in the following table, are standard. For special voltages, consult the factory.

AC/DC Voltage Range
All coils used in Parker FCD valves are designed for continuous duty except where noted. They can remain energized continuously without damage from overheating or mechanical failure. AC and DC voltage ratings (nominal) and normal operating ranges, as shown in the following table, are standard.

All coils used in Parker FCD solenoid valves are either Class "F" or Class "H" molded epoxy, and are constructed in accordance with UL, IEEE, NEMA and other accepted standards.

Holding and Inrush Current (Reference coil charts 1-5 in coil section)

Small, Direct-Acting 2-Way, 3-Way and 4-Way Series 20, 30, 35, 38, and 48 (1/8 to 3/8")Watt Rating and Volt Amperage

Standard Coil Insulation Class	AC		
	Watts	VA Holding	VA Inrush
F	6	16	26
F	10.2	23	37
F	11	20	34
F	16	31	50

Technical Information

Introduction

Solenoid valves are highly engineered products that can be utilized in many diverse and unique applications. In addition to operational functionality, it is important to consider safety, reliability, media compatibility and suitability for the operating environment when selecting the best product for a given application. This section provides a brief overview of the components and functional varieties of solenoid valves available from Parker.

General Information

Operation

Solenoid valves are electrically operated devices used to control flow. They are used for the remote on/off or directional control of liquids, gases and steam. They do not regulate flow.

Solenoid valves consist of two main elements: ***1.)*** An electrical coil in the solenoid, and ***2.)*** A valve body or pressure vessel. The solenoid is the electromagnetic unit that powers (acts to open or close) the valve. The valve is the pressure containing unit that acts to shut off or open media flow.

When the solenoid is energized by an electrical signal, current flow results in the build up of a magnetic field. The field attracts a moveable plunger in the valve. Physical movement of the plunger opens or closes a valve orifice which gives the valve on/off or directional control of media.

In general, solenoid valves are constructed to be: ***1.)*** Normally-Open, or ***2.)*** Normally-Closed. Both designations refer to action of the valve on flow when the solenoid is not energized. There would be, for example, no media flow through a normally closed valve until the solenoid is energized.

The most common types of solenoid actuated valves are: ***1.)*** Direct-Acting, and ***2.)*** Pilot-Operated. In a direct-acting valve, the plunger is in direct contact with the body main orifice, and opens or closes the orifice. In a pilot-operated valve, the main orifice is not directly controlled by the plunger, but by a diaphragm, piston or spool. Pilot operated valves contain both a pilot and a bleed orifice.

Operational Specifications

All solenoid valves are individually rated. Pilot-operated solenoid valves may also have an additional specification, ***Minimum Operating Pressure Differential (MOP***). This is the minimum system pressure differential required to operate the valve and maintain it in the open position. MOP applies only to pilot-operated solenoid valves where system pressure is used to lift the diaphragm off the seat (normally-closed) when the solenoid is energized. Direct-acting or hung-diaphragm valves do not require a minimum operating pressure.

There will be a pressure differential ΔP before the solenoid of a normally-closed valve is energized. Just after flow begins moving through the valve, the pressure differential may decrease. When sizing any normally-closed, normally-open, or universal solenoid valve, pressure differential before and after flow begins must be considered.

Solenoid valves are also rated for ***Maximum Fluid (media) Temperature*** due to temperature limitations of the various disc or diaphragm materials used in their construction.

Response Time, the time necessary for a fully open valve to fully close, or the time necessary for a fully closed valve to fully open, is affected by several factors including: electrical service, media, valve size, system pressure, pressure drop, and operating mode.

The following general response times (nominal) apply for air service using alternating current (AC).

- **Large direct-acting valves (3/8 to 3/4-inch) 20 to 40 milliseconds**
- **Small Direct Acting Valves (1/8 to 1/4-inch) 5 to 10 milliseconds**
- **Small pilot (diaphragm) valves (3/8 to 3/4-inch) 15 to 50 milliseconds**
- **Large pilot (diaphragm) valves (1 to 3-inch) 50 to 75 milliseconds**

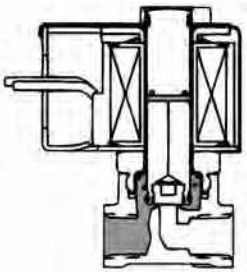
Viscous liquids have very little effect on response time on small direct-acting valves. However, on all other valves, viscous liquids may increase response time by 50 to 100 percent. DC operated solenoid valves will generally increase response time (relative to AC operated solenoids) by as much as 50 percent. Where response time is critical, consult your authorized local Fluid Control Division distributor.

Two-Way Solenoid Valve Operation

Two-way solenoid valves have one inlet and one outlet connection with one main orifice and flow path. A normally closed valve is closed when the solenoid is de-energized, open when the solenoid is energized. A normally open valve is open when the solenoid is de-energized, closed when the solenoid is energized. Consideration should be given to the desired fail-safe condition of the valve when selecting the type of operation.

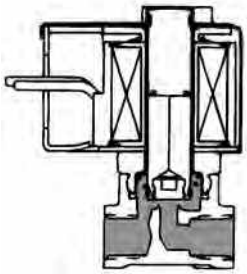
Operational Sequence: Direct-Acting Normally Closed

To Open: When the solenoid receives an electrical signal, a magnetic field is formed which attracts the plunger. The plunger lifts off the main orifice allowing flow through the valve.



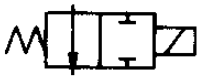
Normally Closed, De-Energized

To Close: When the solenoid is de-energized, it releases its hold on the plunger. The plunger drops and covers the main orifice.



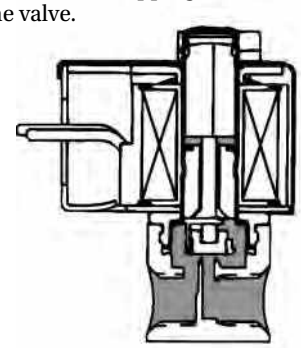
Normally Closed, Energized

Operational Sequence: Direct-Acting Normally Open



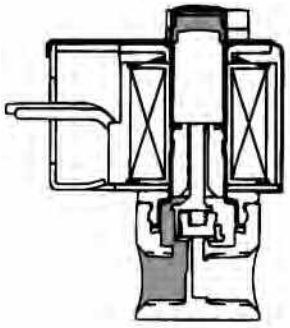
In a normally open valve, the sequence of operation is reversed from that of a normally closed valve. The main orifice is open when the solenoid is de-energized.

To Close: When the solenoid is energized, it attracts the plunger. The plunger covers the main orifice stopping media flow through the valve.

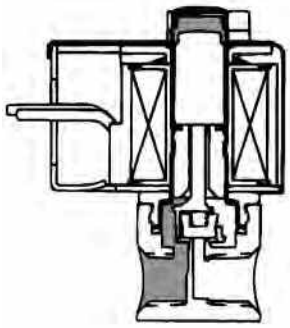


Normally Open, De-energized

To Open: When the solenoid is de-energized, it releases its hold on the plunger. The plunger uncovers the main orifice allowing flow through the valve.



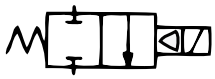
Normally Open, Energized



Normally Closed, Bi-Directional

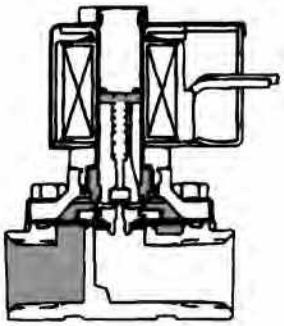
Allows for flow in either direction when energized. (De-energized shown)

Operational Sequence: Pilot-Operated Normally Closed



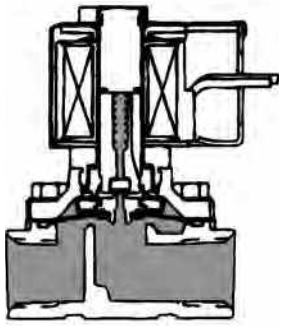
To Open: When the solenoid receives an electrical signal, a magnetic field is formed which attracts the plunger. The plunger covering the pilot orifice lifts off, causing system pressure (holding the diaphragm closed) to drop.

As system pressure on top of the diaphragm is reduced, full system pressure on the opposite side of the diaphragm acts to lift the diaphragm away from the main orifice, thus allowing full media flow through the valve. Since the bleed orifice is dimensionally smaller than the pilot orifice, system pressure cannot rebuild on top of the diaphragm as long as the pilot orifice remains open.



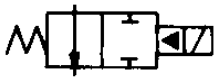
Normally Closed, De-Energized

To Close: When the solenoid is de-energized, it releases its hold on the plunger. The plunger drops and covers the main orifice. System pressure then builds up on top of the diaphragm through the bleed orifice, forcing the diaphragm down until it covers the main orifice and stops media flow through the valve.



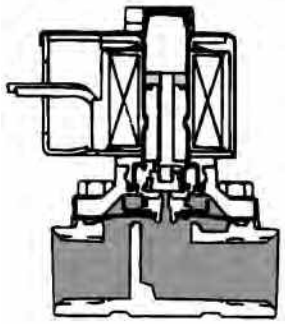
Normally Closed, Energized

Operational Sequence: Pilot-Operated Normally Open



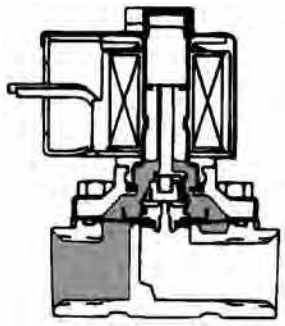
In a normally open valve, the sequence of operation is reversed from that of a normally closed valve. The main orifice is open when the solenoid is de-energized. All other relationships (e.g., the size relationship between the pilot and bleed orifice) still apply.

To Close: When the solenoid is energized, it attracts the plunger. The plunger covers the pilot orifice. System pressure then builds up on top of the diaphragm through the bleed orifice, forcing the diaphragm down until it covers the main orifice and stops media flow through the valve.



Normally Open, De-Energized

To Open: When the solenoid is de-energized, it releases its hold on the plunger. The plunger uncovers the pilot orifice causing system pressure holding the diaphragm closed to drop. As system pressure on top of the diaphragm is reduced, full system pressure on the opposite side of the diaphragm acts to lift the diaphragm away from the main orifice, thus allowing full media flow through the valve.



Normally Open, Energized

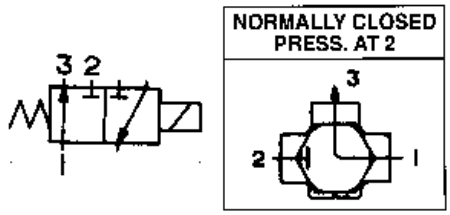
www.parker.com/fcd

Three-Way Solenoid Valve Operation

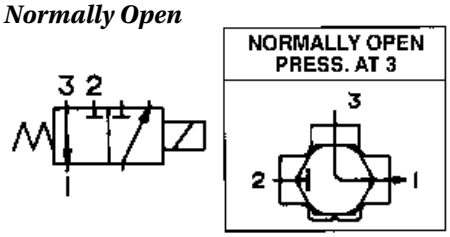
The difference between two-, three- and four-way solenoid valves lies in the construction of the valve body. Three-way valves have three connections and two main orifices. One orifice is always closed, the other always open. Which orifice is open, and which is closed, determines whether the valve is operationally normally open or normally closed.

Operational Sequence: Direct-Acting Normally Closed



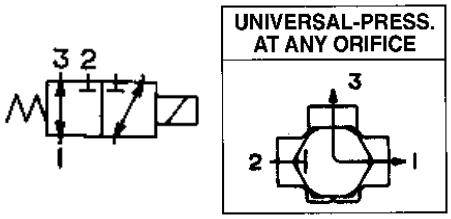
As with a normally closed, two-way valve, the system pressure orifice is closed when the solenoid is de-energized. The second orifice is open to whatever device it is connected to. When energized, the system pressure orifice is opened and the second orifice is closed. This allows system pressure to be applied to the device that was previously being exhausted through the second orifice (now closed).

Normally Open



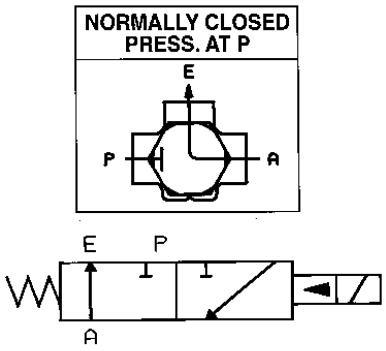
As with a normally open, two-way valve, the system pressure orifice is open when de-energized. The second orifice is closed to whatever device it is connected to. With the solenoid energized, the system pressure orifice is closed, the second orifice opened and the device exhausted.

Universal Construction



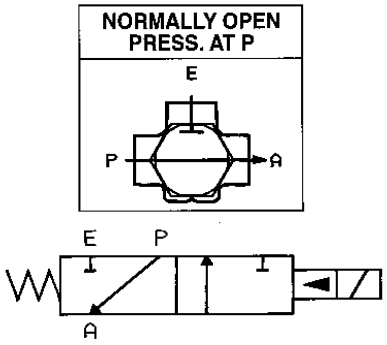
This type of three-way valve may be used in either the normally closed or normally open mode. It can be piped either way. The valve can be used to divert media flow from one outlet connection to the other, or to select one of two inlet flows.

Operational Sequence: Pilot-Operated Normally Closed



As with pilot-operated two-way valves, the plunger movement controls the pilot orifice which controls the pressure holding one of the diaphragms closed against the main orifice. As with direct-acting three-way valves, one orifice is closed when the other is open. When de-energized, flow is from the pressurized device to exhaust and the system pressure port is closed. When energized, flow is from the pressure port to the controlled device and the exhaust port is closed.

Normally Open

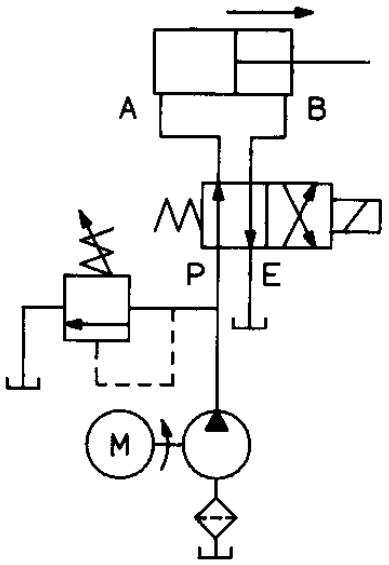


Four-Way Solenoid Valve Operation

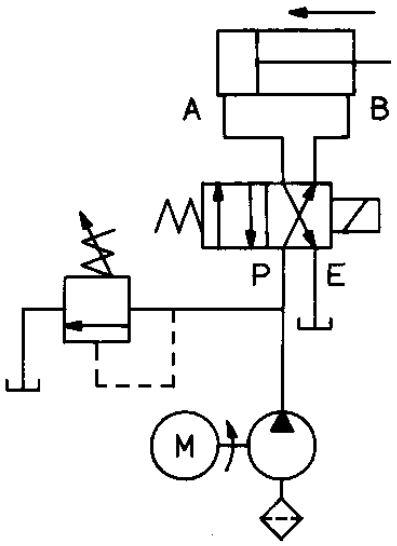
A four-way valve is generally used to operate double-acting cylinders vs. a three-way for single acting cylinders.

A double-acting cylinder has a port at either end of the cylinder body by which fluid can enter and exit. This allows the piston to be moved (propelled) in either direction (double-acting). To distinguish the ports on a double-acting cylinder, one is usually marked "A" and the other "B". A four-way solenoid valve acts to change the direction of fluid flow from the "A" port to the "B" port and, therefore, change direction of the cylinder.

In addition to the "A" and "B" cylinder ports, the four-way valve has a pressure and exhaust port. When de-energized, the pressure port is internally connected to the "A" cylinder port, and the "B" cylinder port is internally connected to the valve's exhaust port. Energizing the four-way valve reverses the system, routing the "A" port to exhaust and the "B" port to pressure. A minimum pressure drop is required for proper operation. Care should be taken not to restrict the exhaust port. Speed controls should be installed in cylinder lines.



De-Energized



Energized

General Data-Solenoid Coils

Power and Voltage

All coils used in Parker FCD solenoid valves are designed for continuous duty except where noted. On AC, inrush current occurs at the moment the solenoid is energized. The continuous current after inrush is holding current.

Typical AC current values are shown in the Coil Section of the catalog. DC solenoids have no inrush. Typical amp ratings for DC are determined by dividing DC watts by DC voltage. All Parker FCD solenoid valves are tested to operate at 15% under-voltage and full pressure ratings. AC and DC voltage ratings (nominal) and normal operating ranges, as shown in the following table, are standard. For special voltages, consult the factory.

AC/DC Voltage Range

All coils used in Parker FCD valves are designed for continuous duty except where noted. They can remain energized continuously without damage from overheating or mechanical failure.

All coils used in Parker FCD solenoid valves are either Class "F" or Class "H" molded epoxy, and are constructed in accordance with UL, IEEE, NEMA and other accepted standards. unless otherwise noted

Testing

All Parker FCD solenoid valves are 100% tested. Coil insulation systems must satisfy performance standards set by the National Electrical Manufacturers Association (NEMA) and tested by Under-writer's Laboratories.

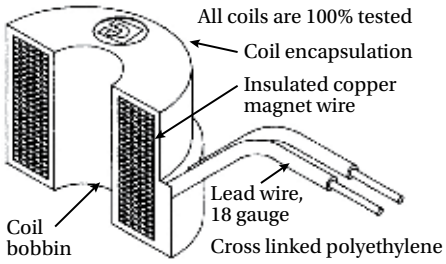
Electrical components of AC and DC coils are tested in accordance with ASTM D2307-78 and become a recognized component under U.L.1446.

The procedure produces data for an evaluation which concludes, a coil with 20,000 hours continuous operation will perform within the same specifications of a zero time coil (new coil).

Coil Construction

Parker FCD coils are epoxy encapsulated. This compound is waterproof and impervious to oil, dust, moisture and most corrosive fumes and vapors.

Coils used in Parker FCD valves are molded and constructed in accordance with UL, IEEE, NEMA and other accepted standards, and are 100% tested.



Temperature

Just as fluid (media) temperatures affect valve body trim; ambient, fluid and power input temperatures affect solenoid coils.

Temperature rise due to power input varies with coil design. Temperature rise due to power input and ambient temperature is directly additive and helps determine the class of coil required for specific valve applications.

When ambient temperature is greater than 25°C (77°F), add the difference of ambient and 25°C (77°F) to the energized coil temperature shown in the table.

The effect of higher fluid temperatures needs to be considered only when fluid temperature is greater than 180°F. Do not exceed the catalog maximum temperature limitation for the valve. Add the difference of your fluid temperature and 180°F to the energized coil temperature shown in the table.

Use the "Saturated Steam Temperature Table" when working with saturated steam. Do not exceed the catalog maximum temperature limitation for the valve. Add the difference of steam temperature and 180°F to the energized coil temperature shown in the table.

Total of additional ambient and fluid or steam temperature to the energized coil temperature shown must not exceed the industrial limit of the coil class selected. Class "H" coil is required if total temperature exceeds "F" Class coil limits. Consult your Fluid Control Division authorized distributor if total temperature exceeds the "H" Class coil limit.

Maximum allowable fluid temperatures are listed for all valves in each section of the catalog.

Minimum allowable fluid temperature is 32° F if moisture is present. Otherwise, -40° F for direct acting valves with NBR seals, -10° F with FKM seals and -10° F for 71214.

Consult factory for confirmation of low fluid temperature limit for specific complete, part number.

Industrial Limits	Total Coil Temperatures													
	AC								DC				AC/DC	
NEMA Limits	155°C (311°F)		180°C (356°F)		155°C (311°F)		180°C (356°F)			180°C (356°F)		180°C (356°F)		180°C (356°F)
Class H														
Class F									155°C (311°F)		155°C (311°F)		155°C (311°F)	
Temperature Margin for Higher Fluid or Ambient Temperature														135°C (243°F)

Valve Sizing

Any given application requires proper sizing of the Parker FCD solenoid valve. If the valve selected is too small, flow conditions will not be met. If too large, system cost will be excessive. Parker FCD solenoid valves are tested and rated using the industry accepted Cv method. This method, used in both the U.S. and Europe, is both simple and accurate.

The correct size valve for an application can be determined by either using the engineered formulae shown below, or by using the curves and simplified formulae on the following pages.

Using Flow Formulas

Gases

If $P_2 > P$ critical

$$Q_m = C_v\sqrt{\frac{P_1\Delta P}{SG}}\ x\sqrt{\frac{520^*}{T}}$$

If $P_2 < P$ critical

$$Q_m = C_v\frac{P_1}{\sqrt{2SG}}\ x\sqrt{\frac{520^*}{T}}$$

Q_m = Rate of flow SCFM (Standard Cubic Feet per Minute) at 14.7 psia and 60 degrees F (standard conditions)

C_v = Flow coefficient

P_1 = Inlet pressure (PSI)

P_2 = Downstream pressure, psia

P critical is approximate 53% P1

ΔP = Pressure differential (PSI) (P_1-P_2)

SG = Specific gravity of gas, relative to air at 14.7 psi and 60 degrees F (standard conditions)

T = Absolute (degrees Rankin) temperature in degrees F. (460 + degrees F.)

Note*: 520 is 460°F + 60°F

Liquids

$$Q = C_v\sqrt{\frac{\Delta P}{SG}}$$

Q = Rate of flow, in gallons per minute

Cv = Flow coefficient

ΔP = Pressure differential (PSI) (P_1-P_2)

SG = Specific gravity relative to water at 60 degrees F

Steam

If $P_2 > P$ critical

$$W = 3C_v\sqrt{\frac{P_1\Delta P}{X}}$$

If $P_2 < P$ critical

$$W = 3C_v\frac{P_1}{\sqrt{2x}}$$

W = Rate of flow in pounds per hour

C_v = Flow coefficient

P^1 = Inlet pressure (PSI)

P_2 = Downstream pressure, psia

P critical is approximate 57% P_1

ΔP = Pressure differential (PSI) (P_1-P_2)

X = Quality of steam (Fraction Dry Steam)

Critical pressure has the following significance in the flow of compressible fluids (gases and steam) through valves. Assuming a fixed upstream pressure of P_1, an increase in flow is obtained as the downstream pressure P_2 is reduced below P_1. Continuing increases in flow are experienced until P2 is reduced to a critical value (P critical). When P_2 is reduced below P critical, no further increase in flow results. P critical can be expressed as a percentage of P_1 with approximate values (53% to 57%) given above.

Note: PSIA is absolute pressure which is gauge pressure plus atmospheric pressure (14.7 psi at sea level).

Definition of Symbols

C_v = Flow coefficient

Q_L = Liquid flow (GPM)

Q_g = Gas flow, standard cu-ft-hr (SCFH)

Q_s = Steam flow (lb./hr.)

P_1 = Inlet pressure (PSI)

P_2 = Outlet pressure (PSI)

ΔP = Pressure differential (PSI) (P1-P2)

K_L = Liquid flow curve factor

K_g = Gas flow curve factor

K_s = Steam flow curve factor

K_{sg} = Specific gravity factor

K_t = Temperature factor

There will be a pressure differential ΔP before the solenoid of a normally closed valve is energized. Just after flow begins moving through the valve, the pressure differential may decrease.

When sizing any normally closed, normally open, or universal solenoid valve, pressure differential before and after flow begins must be considered.

Curves to correct for specific gravity (Ksg) and temperature (K_t) are included. These curves apply to liquids and gases only, not saturated steam.

For liquids with viscosity in excess of 300 SSU, consult your Parker FCD authorized distributor or contact the factory.

The simple and easy to read flow curves for liquids, gases and steam will help in properly sizing valves.

There is a constant relationship between gas and saturated steam flow curves. The flow curve for gases can be used for steam by reading the Ks steam scale.

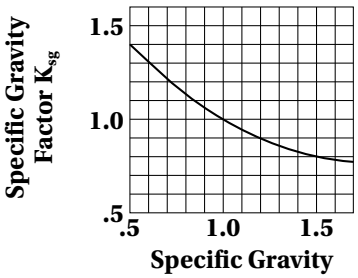
Specific gravity for various compounds are also included.

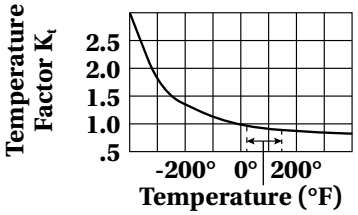
Basic Formulae Using Graphs

Liquid $C_v = \dfrac{Q_L}{K_L \times K_{sg}}$

Steam $C_v = \dfrac{Q_s}{K_s}$

Gas $C_v = \dfrac{Q_G}{K_g \times K_{sg} \times K_t}$





The correction for temperature in the range of 20°F to 150°F is very small, and, therefore, can be ignored in ordinary applications.

Sample Problems

Problem: Liquids

Determine Cv when the required flow is 30 GPM, media is light oil with a specific gravity of 0.82, inlet pressure (P_1) is 36 PSI and outlet pressure (P2) is 0 (ΔP = 36 PSI).

Solution

Use the formula:

$$C_v = \frac{Q_L}{K_L \times K_{sg}}$$

From the liquid flow curve using the pressure drop (36 PSI), read vertically up to the curve. Read horizontally to K_L= 6.

From the specific gravity curve using the specific gravity value (0.82), read vertically to the curve. Read horizontally to K_{sg}=1.1.

From the formula:

$$C_v = \frac{30\ (GPM)}{6 \times 1.1}$$

$$C_v = \frac{30}{6.6}$$

$$C_v = 4.5$$

Problem: Air and Gases

Determine Cv when the required flow is 700 SCFH, media is air (sg=1.0), inlet pressure (P_1) is 70 PSI, outlet pressure (P_2) is 55 PSI, ΔP (P_1 - P_2) = 15 PSI, and air is at 50°F.

Solution

Use the formula:

$$C_v = \frac{Q_g}{K_g \times K_{sg} \times K_t}$$

From the gas and steam flow curve using the inlet pressure (70 PSI), read horizontally to the curve for pressure drop (ΔP=15 PSI). Read vertically down to K_g = 2025.

Air at (50°F) falls into an area of the temperature correction curve where K_t is approximately 1 and can be ignored.

$$C_v = \frac{700}{2025 \times 1.0}$$

$$C_v = \frac{700}{2025}$$

$$C_v = 0.35$$

Steam

Determine Cv when the required flow is 30 lb./hr., media is saturated steam, inlet pressure (P_1) is 80 PSI, outlet pressure (P_2) is 60 PSI and ΔP (P_1 - P_2) is 20 PSI.

Solution

Use the formula:

$$C_v = \frac{Q_S}{K_S}$$

Remembering that the gas and steam flow curves have been combined, from the gas and steam flow curve using the inlet pressure value (80 PSI) read horizontally to the curve for the pressure drop (ΔP=20PSI). Read vertically down to K_S = 121.

From the formula:

$$C_v = \frac{30}{121}$$

$$C_v = 0.25$$

Formula Variations

The examples used here for liquids, gases, and steam show how to determine C_v. These same formulae can be transposed to determine other useful data once a specific value has been selected to meet the desired C_v (see formula variations table below).

Media	Known	Find	Formula	Curve
Liquids	C_V, ΔP, K_{sg}	Q_L	$Q_L = C_V \times K_L \times K_{sg}$	Liquids
	P_1, C_V, Q_g, K_{sg}	ΔP	$K_L = \frac{Q_L}{C_v \times K_{sg}}$	Liquids
	Apply K_L to the liquid factor curve with P_1 to find ΔP.			
Gases	C_V, K_g, K_{sg}, K_t	Q_g	Q_g, $C_V \times K_g \times K_{sg} \times K_t$	Gases
	P_1, C_V, Q_g, K_{sg}, K_t	ΔP	$K_g = \frac{Q_g}{C_v \times K_{sg} \times K_t}$	Gases
	Apply K_g to the gas factor curve with P_1 to find ΔP. After solving for P (pressure differential), a general rule of 2(ΔP) will equal the minimum pressure for a required flow.			
Steam*	C_V, ΔP	Q_s	$Q_s = C_V \times K_s$	Gases Steam Scale
	P_1, C_V, Q_s	ΔP	$K_s = \frac{Q_s}{C_v}$	Gases Steam Scale
	Apply K_s to the gas factor curve with P_1 to find ΔP.			

* In all cases, steam is considered saturated.

Fluid Compatibility

General Information

The following table lists many of the liquids and gases commonly considered for handling with solenoid valves. In some cases, specific limitations are listed, and in other cases, Parker FCD solenoid valves are not recommended. For media not listed in the tables, consult the factory for specific recommendations.

Trim Materials

Buna "N" (Nitrile) Symbol NBR

A soft synthetic compound, Buna "N" is the most widely used elastomer in industry today. Buna "N" is standard disc and diaphragm material in Parker FCD solenoid valves. It has excellent service characteristics for use with water, light oil and gas in a temperature range of (-10°F) to 180°F.

Ethylene Propylene Symbol EPDM

Introduced to the rubber industry in 1961, Ethylene Propylene is used primarily for applications involving hot water or steam service. It has excellent service characteristics for many liquids in a temperature range from (-10°F) to 300°F.

Viton* Symbol FKM

A soft fluoroelastomer, Viton was originally developed to handle hydrocarbons including gasoline, jet engine fuels and various solvents. It handles media in a broader temperature range than Ethylene Propylene. Its temperature range extends from (-10°F) to 350°F. Viton is also an ideal material for handling a wide range of chemical media.

Teflon* Symbol PTFE

Another fluorocarbon, Teflon is available as a solid material or combined with fillers. Teflon will withstand chemical attack from almost any fluid. Its temperature range extends from (-320°F) to 350°F. Because it is not easily fabricated and known to have cold flow characteristics, its applications are limited.

**** DuPont Co. Trademark***

Neoprene Symbol CR

Most elastomers are resistant to either petroleum lubricants or oxygen. Neoprene has limited resistance to both. Combining wide spectrum of resistance with a temperature range of (-10°F) to 180°F account for its use in many applications.

Urethane Symbol U

A synthetic compound, Urethane is widely used where high strength and abrasive resistance are required. Its temperature range is similar to Buna "N" (-10°F) to 160°F.

Guide to Media andMaterial Compatibility for Parker FCD Solenoid Valves

Key:

A = Aluminum[1]
AT = Acetal
BR = Brass
C = Copper
CE = Celcon
CR = Neoprene
EP = Ethylene Propylene
NBR = Buna "N"
R = Ruby
S = Silver
SS = Stainless Steel[2]
T = PTFE
U = Urethane
V = FKM
F = KEL-F (PCTFE)
K = Kalrez (PFPM)
DEL = Delrin

[1] Available by special order only.
[2] Stainless Steel 302, 303, 305, 316

Factors of temperature, pressure and concentration may render material compatibility unacceptable.

Fluid Compatibility Chart

The fluid compatibility charts on the next two pages are presented merely as a guide. This data has been compiled from available information obtained from laboratory tests. Actual valve applications may be more severe than the laboratory conditions, so the information presented here should be used as a guideline in choosing materials that are compatible with the fluid to be controlled and the ambient conditions of the installation. This information should by no means be used alone in determining the proper materials of construction of a valve. Please consult factory for further information if needed.

Seal Material Designations

ASTM Designation	Commercial Designations and/or Trade Names
NBR	Buna-N, Nitrile
EPDM	Ethylene Propylene
FKM	Fluorinated Hydrocarbon, Viton®
PCTFE	Kel-F
PTFE	Teflon®, Rulon®
PFPM	Kalrez
CR	Neoprene
U	Urethane
R	Ruby

Viton® and Teflon® are Registered Dupont Co. trademarks.
Rulon®AR is a Furon-Advanced Polymers Division trademark.

1 Cv = 14.28 Kv
1 gpm = 3.785 liters/min (U.S. gallon)
1 cfm = 28.317 liters/min
1 liter/min = 0.0353 cfm

Temperature

Degrees C = (Degrees F- 32) (5/9)
Degrees F = (Degrees C) (9/5) + 32

Torque

1 in lb. = 0.113 Nm
1 in lb. = 1.15 cm Kg

Glossary of Terms

Bleed Orifice - An internal orifice which controls the closing rate of a pilot operated solenoid valve. Also called the equalizer hole.

Bubbletight Sealing - Air leakage between the internal sealed ports of a valve in either the energized or de-energized position is undetectable in a 5 second soap bubble test. Equivalent to 2 cc/min.

Continuous Duty - A rating given to a valve that can be energized indefinitely without overheating or failure under normal operating conditions.

Cover - The upper half of a diaphragm type solenoid valve.

Current Drain - The amount of current (expressed in amperes) that flows through the coil of a solenoid valve when it is energized.

Cv Factor - The Cv factor of a valve is the quantity of 60°F water, expressed in gallons per minute, which flows through a valve with one PSI pressure drop. Cv values for Parker solenoid valves are indicated in the catalog listings in each section.

Cycle - A complete operation of a solenoid valve. For example: opening a normally closed valve and then closing it is one cycle.

Cycle Rate - The number of times a valve is capable of opening and closing its main orifice in a particular time interval.

Cycles Per Minute (CPM) - The number of times a valve is capable of opening and closing its main orifice in one minute.

Dead End Gas Service - A condition in which a valve is energized but has no cooling fluid flowing through it because of a dead end line (for example: a cylinder pressurized for a long period of time).

Diaphragm - An elastomeric or other material seal which covers the main orifice.

Disc - A material used in a plunger to seal an orifice.

Drip-proof - See NEMA classifications

Drip-tight - See NEMA classifications

Dust-tight - See NEMA classifications

Duty Cycle - The longest time that a valve is energized, followed by the shortest time that it is de-energized. Expressed in

$$\text{percent} = \frac{\text{on time}}{\text{on time + off time}} \times 100$$

Elastomer – Material having elastic properties. These materials are generally used for sealing purposes.

Electromagnet - Electrical part consisting of a copper windings (solenoid) which, with a magnetic yoke (armature), when electrical current flows through it, generates a magnetic flux attracting the plunger.

Explosion-Proof Construction - A solenoid valve constructed to meet the specifications of the appropriate approval agency for operation in hazardous locations. See also NEMA classifications.

Floating Top Seal - A plunger assembly construction in two-way normally open and three-way valves in which the top seal is moveable against a spring within the plunger. The purpose of this construction is to prevent seal swell or shrinkage due to fluid or temperature from interfering with valve operation. It also allows the spring to continue to move the seal against the valve seat in spite of wear.

Flow - The continuous movement of fluid caused by a pressure differential.

Flow Capacity -The amount of fluid a valve will pass under given temperature and pressure conditions in gallons per minute or cubic feet per minute as measured at the outport. Cv is a measure of flow capacity.

Flow-rate - The amount of fluid that passes a given point at a given period of time.

Flux Frame - The magnetic steel frame surrounding the coil which provides for efficient travel of magnetic flux. Also called magnetic frame assembly.

Flux-plate - A magnetic steel plate used in the magnetic circuit of a solenoid valve to help carry magnetic flux from the housing to the sleeve assembly.

Parker Hannifin Corporation
Fluid Control Division

www.parker.com/fcd

Hazardous Locations - As defined by Underwriter's Laboratories, Inc. most Parker explosion-proof valves are approved for use in the following hazardous locations: Class I, Group C and D, Class II, Group E, F and G. See also NEMA classifications.

Class I locations are those in which flammable gases or vapors are or may be present in the air in sufficient quantities to produce explosive or ignitable mixtures. Group C atmospheres contain: acetaldehyde, cyclopropane, diethyl ether, ethylene and isoprene. Group D atmospheres contain: gasoline, hexane, naphtha, benzene, alcohols, acetone, lacquer, solvent vapors and natural gas.

Class II locations are hazardous because of the presence of mixtures of combustible dust. Group E atmospheres contain metal dust including aluminum, magnesium, and their commercial alloys, and other metals of similarly hazardous characteristics. Group F atmospheres contain carbon black, coal or coke dust. Group G atmospheres contain flour, starch or grain dust.

Heat Rise - The difference between the temperature of the solenoid coil when energized and de-energized in a constant ambient temperature. As current flows through a coil, heat is generated. The coil temperature rises until the coil housing dissipates heat as fast as it is generated, and the temperature stays at a stabilized level.

Holding Current - The current flowing through the coil after it as stabilized, to hold the plunger in the energized position. Value is normally about ½ of inrush current.

Inrush Current – The current at the moment of energization of AC voltage coils. This current is of greater value than holding current due to low inductance at the moment of energization. Supply transformers should be sized using this value.

Insert - A material used in a plunger assembly to seal an orifice.

Insert Materials

BUNA-N - A soft synthetic rubber used as the standard insert material in valves having rubber inserts. Also known as nitrile.

Ethylene Propylene - A soft synthetic insert material used for water above 180°F and steam.

Delrin - A thermoplastic used in precision parts requiring high stiffness, low friction and excellent dimensional stability.

FKM - A soft synthetic insert material used for high temperature and with many fluids not handled by Buna-N. Standard seal material in several valve series.

Neoprene – A soft synthetic rubber used as an insert material on certain types of freons.

Nitrile -See Buna-N.

PCTFE- A synthetic material used for many semi corrosive and corrosive media. Also for high temperatures.

Ruby - A synthetic corundum (hard stone) with high hardness values and total inertia for all types of fluids. Working temperatures from -40° to +180°C

Rulon - A synthetic plastic material used for semi corrosive media.

Intermittent Duty Coil - A valve coil not designed for continuous duty but which will perform satisfactorily for a specified duty cycle.

Leakage, External - The leakage between the internal part of the valve and the external part of the valve. Parker valves are bubbletight.

Leakage, Internal - The leakage between the internal sealed ports of a valve in either the energized or de-energized position. Leakage rate is normally described in cc (cubic centimeters) per minute or as bubbletight.

Manual Override - A mechanical device that permits manual opening of normally closed valves or closing of normally opened valves.

Media – The fluid flowing through the valve.

Metering - A mechanical device that permits manual adjustment of fluid flowing through a valve. Often referred to as speed control.

NEMA - National Electrical Manufacturers Association. Recommends suitable materials and constructions to meet coil enclosure installation types.

NEMA Classifications (Enclosures)

Drip-proof - NEMA Type 2 enclosure must prevent failing moisture or dirt from interfering with operation.

Drip-tight - NEMA Type 2 enclosure must exclude falling liquids or solids.

Dust-tight - NEMA Type 5. Option EX meets this requirement.

General Purpose - NEMA Type 1 enclosure suitable for general purpose application indoors under normal atmospheric conditions.

Hazardous Locations - NEMA Type 7, 9, 9A explosion proof construction.

Submersible - NEMA Type 6.

Watertight - NEMA Type 4X.

Weather Resistant - NEMA Type 3.

Oxygen Service - Valves specified for use with oxygen are furnished free of any petroleum based oil. Special cleaning may be required and should be so specified.

Pilot Orifice - An internal orifice which controls opening characteristics of a pilot operated solenoid valve. In a pilot operated solenoid, the plunger covers the pilot orifice.

Plunger - Moveable portion of a solenoid valve operator which controls media flow.

Plunger Spring (or return spring) - Used to hold the MP in position and to return it to position after the action of the electromagnet.

Port - An opening or passageway for the inlet or outlet of fluid in a valve. The terminus of the port is threaded with National Pipe Threads (NPT) to accommodate line connection. A port designated with an NTPF port indicates one with dry seal threads.

Port, Cylinder - A port which provides a passage to or from an actuator. This port is a common port and in multi-purpose valves is called a common port.

Port, Exhaust - A port which provides a passage to the atmosphere or downstream piping.

Port, In - A port which provides a passage from the source of fluid.

Port, Out - The port where the fluid leaves the two-way valve.

Port, Normally Closed - The port that is closed to fluid flow when the valve is de-energized.

Port, Normally Open - The port that is open to fluid flow when the valve is de-energized.

Power Consumption - The number of watts a solenoid valve draws when it is energized.

Pressure - A force per unit area used as a propellant of air or fluid. Pressure is induced into a system by means of a pump, compressor or gravity. Absolute pressure is measured in pounds per square inch absolute (PSIA). Absolute pressure is the reference of pressure with atmospheric pressure used as a base (14.7 pounds per square inch absolute at sea level). (0 PSIG = 14.7 PSIA).

Pressure Definitions

Burst Pressure - The pressure that would cause the weakest section of the valve to fail and cause external leakage when pressure is reduced back to rated pressure. Dependent on the individual valve constructions. For most valves it is at least 5 times rated pressure. (This is a destructive test.) In some of the higher pressure valves (2000 PSI or more) the factor may be slightly lower. Consult factory.

Maximum Operating Pressure Differential (MOPD) - The maximum difference in between the pressure at an INlet port and the pressure at an OUTlet port at which a solenoid will operate, either to open or close one or more ports when energized or de-energized.

Minimum Operating Pressure (MOP) - The minimum pressure a pilot operated valve requires for proper operation.

Minimum Operating Pressure Differential - The minimum difference between the pressure at an INlet port and the pressure at an OUTlet port required for proper operation of the solenoid valve. The minimum operating pressure must be maintained throughout the operating cycle of pilot-operating valves to assure proper shifting from the closed position to the open position or vice-versa.
Note: Two- and three-way pilot-operated valves will start to move to their normal positions when the pressure falls below the minimum operating pressure.

Direct acting valves do not require a minimum pressure to operate.

Proof Pressure - The maximum pressure the valve may be exposed to without suffering any damage. It need not be operable at this pressure. For most valves it is at least 1½ times the rated pressure. (This is a non-destructive test).

Pressure Ratings

Extended Pressure Ratings - Are pressure ratings which can be extended beyond the Higher Than Standard Pressure Ratings by means of mechanical or electrical modifications.

When higher than standard or extended pressure ratings are to be employed, consideration must be given to the possible adverse effect on valve life, flow, and noise level.

Higher Than Standard Rating - Are pressure ratings which can be made available through minor changes on a solenoid valve. In most cases, this is possible only when UL approval is not a factor.

Safe Working Pressure - Twenty percent of the pressure which causes external leakage. The valve is not expected to operate at this pressure unless the MOPD is a value less than the SWP.

Standard Catalog Ratings - Are pressure ratings established to conform to Underwriter's Laboratories, Inc., and to do so under the most adverse conditions of pressure, low or high voltage, maximum heat rise, etc. The standard ratings listed in this catalog for most applications should be considered conservative.

Response Time - The length of time required for an operating mechanism of a valve to move from the fully closed to the fully open position, or vice versa. Response time will vary according to pressure, media, voltage and system. It also varies with the type of valve (direct operated or pilot operated). For specific valves consult factory with complete application details.

The following general response times (nominal) apply for air service using alternating current (AC).

- **Large direct-acting valves (3/8 to 3/4-inch) 20 to 40 milliseconds**
- **Small Direct Acting Valves (1/8 to 1/4-inch) 5 to 10 milliseconds**
- **Small pilot (diaphragm) valves (3/8 to 3/4-inch) 15 to 50 milliseconds**
- **Large pilot (diaphragm) valves (1 to 3-inch) 50 to 75 milliseconds**

Viscous liquids have very little effect on response time on small direct-acting valves. However, on all other valves, viscous liquids may increase response time by 50 to 100 percent. DC operated solenoid valves will generally increase response time (relative to AC operated solenoids) by as much as 50 percent. Where response time is critical, consult your authorized local Fluid Control Division distributor.

Parker Hannifin Corporation
Fluid Control Division
1 800 825 8305 (1 800 Valve05)
www.parker.com/fcd

Shading Ring - A single coil located in the stop in which a secondary flux wave is induced during AC current operation.

Sleeve - The stainless steel tube of the solenoid operator housing the plunger and stop, and over which the coil is positioned.

Solenoid - The electrical portion containing the coil and magnetic frame and/or enclosure.

Specific Gravity - The ratio of the density (mass of a unit volume) of a substance to the density of a reference substance. Normally the reference substance is water for liquids and air for gases.

Spring-Loaded - The term used to indicate that the valve has a plunger return spring. A spring-loaded plunger permits the valve to be mounted in any position without causing malfunction.

Standard Construction - The type of construction used in manufacturing valves listed in this catalog that have grommet or conduit electrical outlets not including explosion-proof type.

Stop - The stationary portion of the magnetic attractor inside the sleeve assembly.

Temperature Range - Parker valves are equipped with high quality coils suitable for continuous energization. If the normal ambient temperature of 25°C is continuously exceeded or if 40°C is occasionally exceeded, a higher class coil may be required depending on the fluid temperature, flow rate, duty cycle, other heat sinks and ventilation of the area.

The permissible coil temperature by the change of resistance method for standard coils is 110°C for Class A and 130°C for Class B.

Higher coil classes available are F 155°C and H 180°C.*

*Underwriter's Laboratories Inc. requires for listed valves that coil temperature stays lower than the stated limits. The limits are 120°C for Class B, 140°C for Class F and 160°C for Class H.

Ambient And Media Temperature Limitations

Minimum Media - If moisture is present 32°F, otherwise minus 40°F for poppet valves.

Maximum Media And Maximum Ambient - As listed in catalog for each valve.

Note: Ambient temperature and coil temperature rise are additive. Media temperature is not.

Valve Body - Main part of the pressure vessel with the process connections (fittings), seat and main pilot orifices.

Velocity - The speed at which fluid moves, expressed in terms of distance per time, such as feet per second.

Vibration And Shock - Most valves will resist 10G's or more. For V40 series valves, consult Parker.

Viscosity - The amount of resistance to flow. Specific for each media.

Port Marking (2-Way Valves) - A The table below indicates how the ports of 7000 Series solenoid valves are identified.

Valve Type	Port Marking	
	Inlet	Outlet
71211	1	2
71214 (Noryl Body)	**	*
71214 (Teflon, SS Body)	2	1
71215	2	1

*Partial list

Note: This check list is intended to serve as a preliminary guide to common valve failure troubleshooting, and is not intended to contain recommendations for proper solenoid valve or systems operation or design. For proper solenoid valve usage, follow manufacturer's recommendations. Improper system design may result in ineffective valve operation.

General Troubleshooting Discussion

Note 1) If the valve fails to operate because of a burn-out or shorted coil, the cause of the burn-out must be determined before the new unit solenoid, or coil for explosion-proof valves, is installed. Usually the cause is in the mechanical portion of the unit body, therefore, the entire solenoid valve must be inspected.

Note 2) If the coil has failed, a complete Parker FCD unit solenoid, or coil for explosion-proof valves, should be installed. Be sure to turn off all electrical power in the valve circuit prior to any disassembly.

Note 3) If the solution requires the replacement of a defective part or parts, a complete Parker FCD rebuild kit should be used. Be sure all parts in the rebuild kit are installed in the valve, not only the part or parts deemed defective. As this procedure requires opening the valve body (pressure vessel), be sure to bleed all system pressure to zero. If either the plunger tube assembly or the bonnet screws are loosened to relieve trapped valve pressure, do so carefully. Do not completely remove the plunger tube assembly or the cover screws until the bleeding is complete. Refer to the appropriate I & M Sheet for instructions.

Note 4) In most installations, after a solenoid valve has been energized for a short time, the solenoid housing will be hot to the touch. This is not an indication of a failure or possible failure. It is perfectly normal.

Note 5) Regardless of system size, water hammer must be considered and controlled to protect piping systems and solenoid valves from its effects. Water hammer occurs when the flow of a non-compressible fluid in a pipe is abruptly stopped. Water hammer is not always identified by noise and vibration. Examine diaphragms, plunger discs and other internal parts for tears, distortion and other damage. Replace internal parts with a rebuild kit and modify the piping system. Commercially available water hammer arresters range from flexible rubber hose, a simple extension pipe to a type of permanently sealed chamber.

Hints

1.) Never replace a burned-out coil or unit solenoid until the cause of the burn-out has been determined, ie: missing parts, plugged plunger tube, worn plunger, over voltage, etc.

2.) Before reassembly of valve body, if possible, flush out inlet to valve.

3.) Use a flat screwdriver placed on top of plunger tube to test magnetic circuit.

4.) If the cause of failure is the presence of foreign matter, install a strainer or filter in the upstream (inlet) side of the valve.

Symptoms

Five basic symptoms indicate a solenoid valve is not operating properly to specifications:

1.) Failure to operate (shift position) when energized.

2.) Failure to operate (shift position) when deenergized.

3.) Internal or external leakage.

4.) Erratic flow.

5.) Excessive solenoid noise when energized even though any of the above symptoms does not exist. (In some AC installations, a very slight hum may be noticeable and is normal.)

Agency Approvals

Most solenoid valves are approved by Underwriter's Laboratories (UL) and certified by the Canadian Standards Association (CSA). Some FCD valves meet the requirements and are SIL3 capable, see sample certificates on the following pages.

Consult factory for additional details.

Vacuum

While many 2-Way direct acting/direct lift solenoid valves with elastomeric seals listed in this catalog can be used on vacuum, the standard 100% production leakage test does not ascertain that the valves are sufficiently tight for severe vacuum applications. We do, however, design, produce, and test many vacuum valves to meet specific OEM customer requirements. Therefore, we invite you to consult us for your vacuum valve applications.

Note: vacuum source should be connected to the outlet port for the proper operation.

Fluid Temperature Limitations

32°F Minimum Fluid Temperature if moisture is present. Otherwise minus 40°F for direct acting valves with NBR seals, minus 10°F with FKM seals. For exceptions, consult the factory.

Temperature Classifications

Temp. Class.	Maximum Allowable Surface Temperature	
	C	F
T1	450	842
T2	300	572
T3	200	392
T4	135	257
T5	100	212
T6	85	185

Types of Protection of Solenoids for Hazardous Environments

Standards are established by the European Committee for Electro-Technical Standards (ATEX). Degrees of Protection of electrical parts and operating temperatures are defined by various European standards.

The following chart show the Degree of Protection for the selected coils along with the maximum surface temperatures for each temperature code classification.

Types of Protection

Protection Class	Degree of Protection
IP-65	Protection against ingress of dust (dust proof) Protection against contact with internal parts Protection against a water jet from a nozzle from all directions
IP-67	Protection against ingress of dust (dust proof) Protection against contact with internal parts Protection against a water when the equipment is immersed in water under specific pressure and time conditions

Response Time

The response time of a solenoid valve depends on many factors such as voltage, frequency, pressure, media, temperature (including coil) and the type of valve. Variations in these factors can have a significant effect on the response time. The following tabulation lists the approximate response times for several different types of valves. The times given are for the valves to go from closed position to open or from open position to closed.

Valve Response Time AC* (on Air)

Valve Type	Response Time (milliseconds)
Direct Acting	4-15
Small Pilot Operated (Piston)	30-90
Large Pilot Operated (Piston)	100-150
Small Pilot Operated (Diaphragm)	30-60
Large Pilot Operated (Diaphragm)	60-160
Direct Lift (Diaphragm)	30-60

Operating Speed (Cycle Rates)

Operating speed is defined as the maximum number of cycles (On/Off) per minute that a solenoid valve is capable of completing. It is dependent upon the response time characteristics of the valve. Many of our small, short stroke, direct acting valves are capable of operating at rates over 2,000 cycles per minute. However, for normal operation lower cycle rates as shown are usually recommended.

Valve Operating Speed AC* (on Air)

Valve Type	Operating Speed (Cycles/min.)
Direct Acting	600
Small Pilot Operated (Piston)	400
Large Pilot Operated (Piston)	150
Small Pilot Operated (Diaphragm)	300
Large Pilot Operated (Diaphragm)	200
Direct Lift (Diaphragm)	200

***Response times and operating speeds for DC valves used on air or any valves used on liquids can be much greater than listed above. (As much as 50-100% greater in some cases). Consult Factory for exact operating specifications if response time and operating speed are critical to the application.**

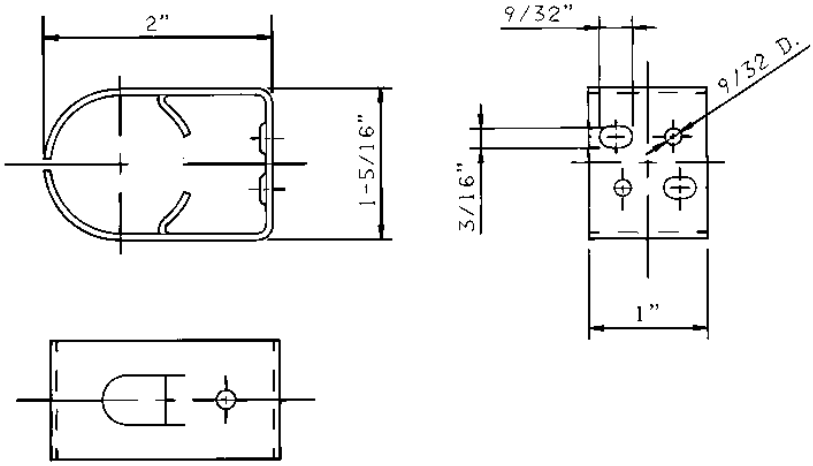
Mounting Bracket A

Part No. KC99-003

For the following valves:

Bracket is available as a standard feature with these valves.

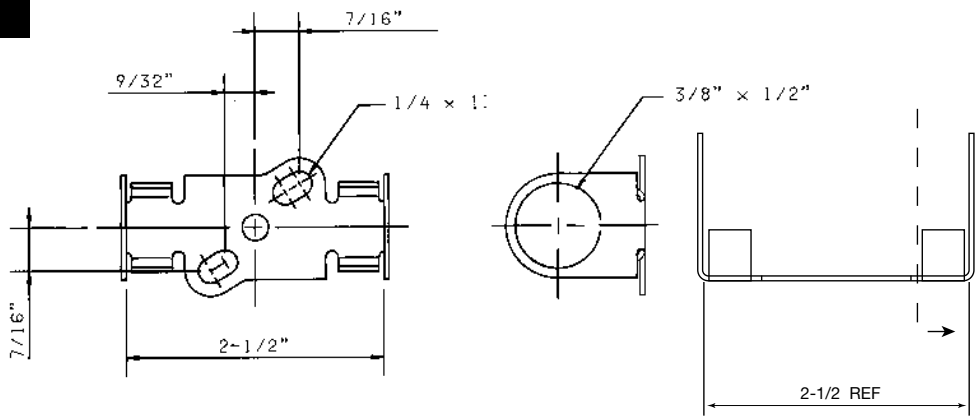


Mounting Bracket B

Part No. MA99-007

For the following valves:

Bracket is available as an option for these valves. Use a suffix "w" on complete part number.

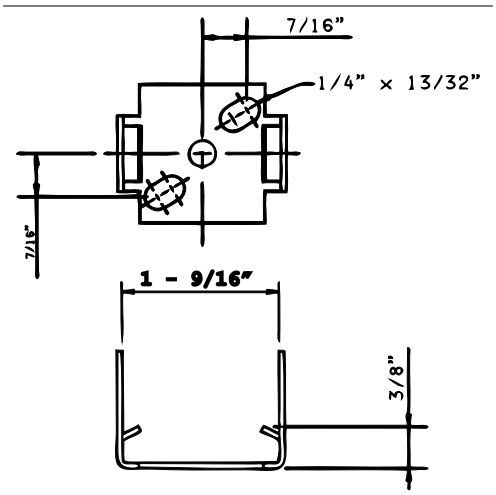


Mounting Bracket C

Part No. KB99-007

For the following valves:

Bracket is avaialble as an option for these valves. Use a suffix "w" on com.



Technical Reference

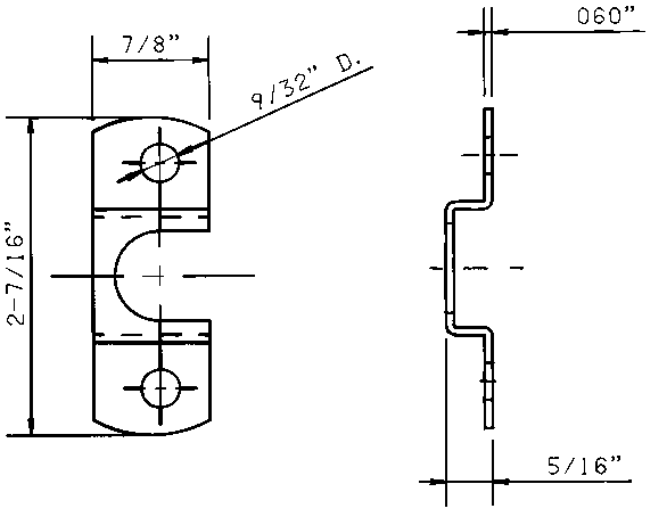
Parker Hannifin Corporation
Fluid Control Division
1 800 825 8305 (1 800 Valve05)
www.parker.com/fcd

Mounting Bracket D

Part No. AB99-002

For the following valves:

Bracket is available as a standard feature with these valves.

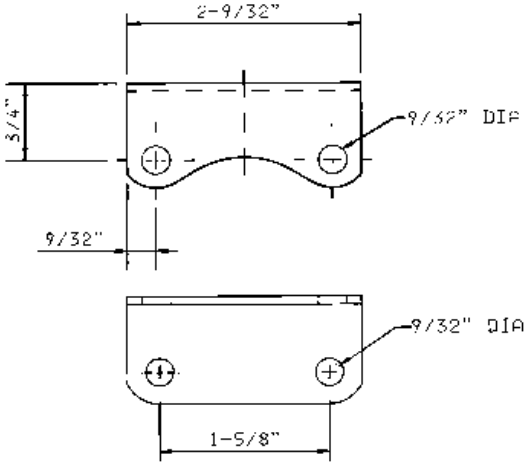


Mounting Bracket E

Part No. MA99-014

For the following Part Numbers:

Bracket is available as an option for these valves. Use a suffix "w" on the complete valve part number.

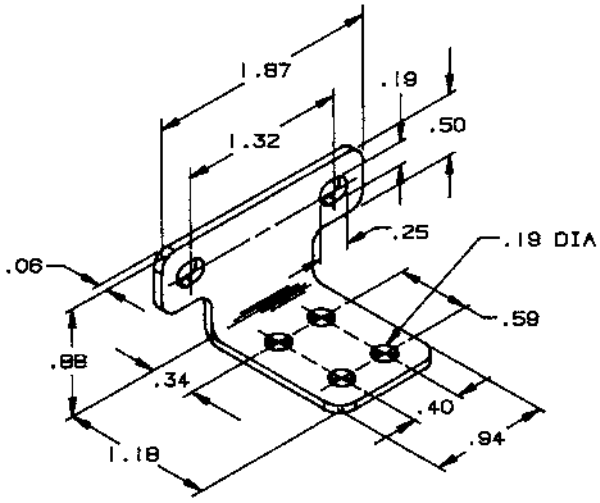


Mounting Bracket F

Part No. 4K007

For the following valves:

Bracket is available as an option.

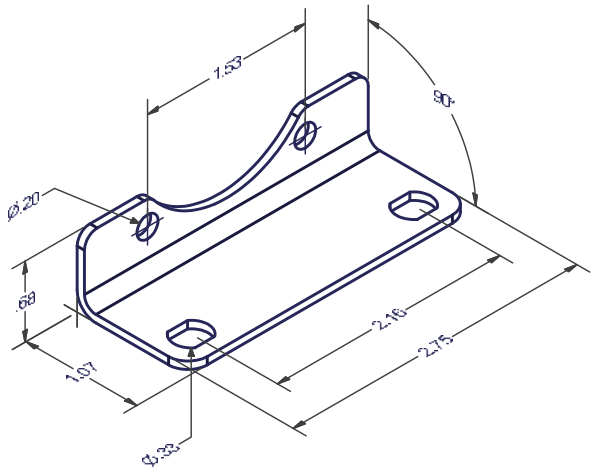


Technical Reference

Mounting Bracket G

Part No. Mech B2

For the following valves:

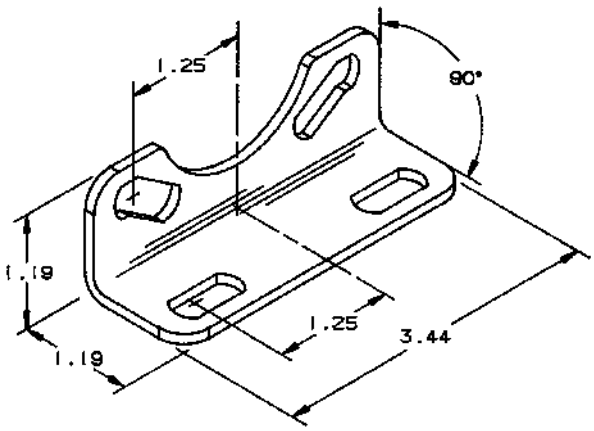


Mounting Bracket H

Part No. Mech B8

For the following valves:

Allows for a flexible side mounting option.



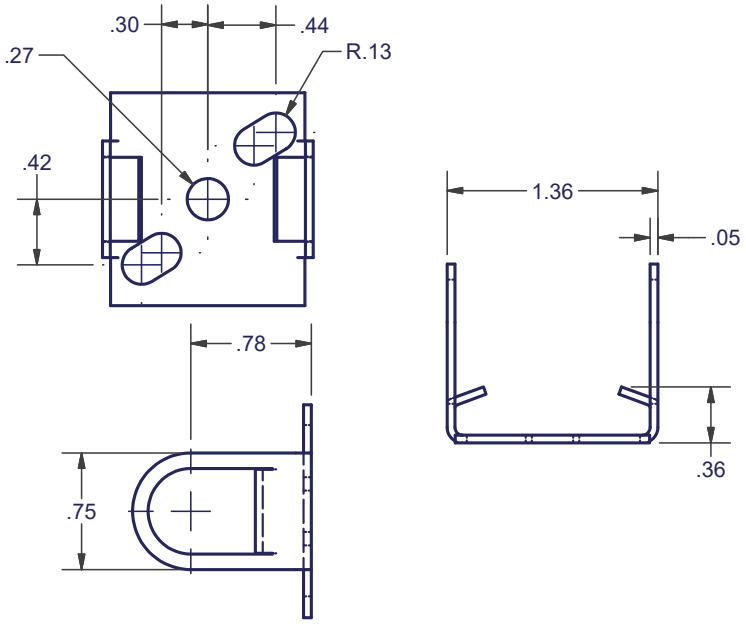
Parker Hannifin Corporation
Fluid Control Division
1 800 825 8305 (1 800 Valve05)
www.parker.com/fcd

Mounting Bracket I

Part No. KB99-016

For the following valves:

Bracket is available as an option on these valves. Use suffix "w" on complete valve part number.

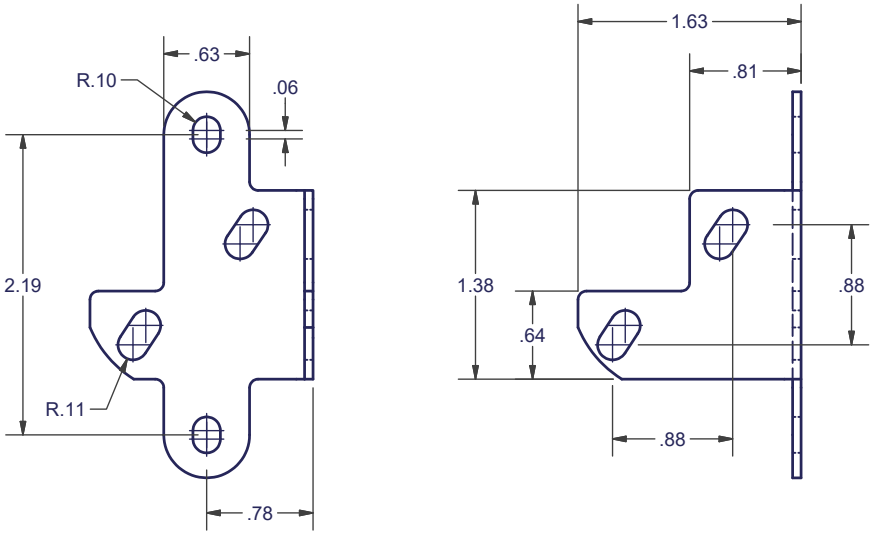


Mounting Bracket J

Part No. Mech B5

For the following valves:

Available as an option.



Technical Reference

Parker Safety Guide for Selecting and Using Fluid Control Division Products including Valves, Assemblies and Related Accessories

WARNING: **Failure or improper selection or improper use of Parker Fluid Control Division Products, including valves, assemblies or related accessories ("Products") can cause death, personal injury and property damage. Possible consequences of failure or improper selection or improper use of these Products include but are not limited to:**

- Gas leakage leading to explosion or rupture of a pressure vessel.
- Leakage or other release of toxic or otherwise hazardous liquids or gases.
- Unintended or mistimed cycling or motion of machine members. Or failure of machine members to cycle.
- Sudden moving or falling objects.
- Work piece or component parts being thrown off at high speeds.
- Failure of a device to function properly. For example, failure to clamp or unclamp an associated item or device.
- Electrical shorts, burns, burn out of equipment or fires.

Before selecting or using any of these Products, it isimportant that you read and follow the instructions below.

1.0 GENERAL INSTRUCTIONS

1.1. Scope: This safety guide is designed to cover general guidelines on the selection, installation, operation, and maintenance of these Products. This safety guide is a supplement to and is to be used with the specific Parker publication for the valve, assembly or related accessory being considered for use. Parker publications are available at www.parker.com or by calling 1-800-CPARKER.

1.2. Fail-Safe: All Products can and do fail without warning for many reasons. Design all systems in a fail-safe mode so that failure of the Products will not endanger persons or property.

1.3 Distribution: Provide a copy of this safety guide to each person that is responsible for installation, operation, and maintenance of these Products. Do not select or use these Products without thoroughly reading and understanding this safety guide as well as the specific Parker publications for the Products considered or selected.

1.4 User Responsibility: Due to the wide variety of operating conditions and applications for these Products, Parker and its distributors do not represent or warrant that any particular Parker Fluid Control Product is suitable for any specific end use system. This safety guide does not analyze all technical parameters that must be considered in selecting a Product. The user, through its own analysis and testing, is solely responsible for:

- Making the final selection of the Product;
- Assuring that the user's requirements are met and that the application presents no health or safety hazards;
- Providing all appropriate health and safety warnings on the equipment on which the Products are used; and
- Assuring compliance with all applicable government and industry standards.

1.5 Additional Questions: Call the appropriate Parker technical service department if you have any questions or require any additional information. See the Parker publication for the Product being considered or used, or call 1-800-CPARKER, or go to www.parker.com for telephone numbers of the appropriate technical service department.

2.0 PRODUCT SELECTION INSTRUCTIONS

2.1 Selection: Consult the specific Parker Fluid Control publication for the Product being considered for use. Confirm the choice of Product with Parker Fluid Control's technical consultants prior to placing orders for the Product or installing and using the Product.

2.2 Chemical Compatibility: Elastomer seal material used in the Products must be properly selected based on compatibility with the gases, liquids or additives being conveyed in the Product. Any exposure to non-compatible gases, liquids or additives may result in failure or degradation of the seals and leakage from the Product. Such failure or degradation could happen immediately or at anytime over the life of the Product.

3.0 PRODUCT ASSEMBLY AND INSTALLATION INSTRUCTIONS

3.1 Inspection: Prior to assembly, all components must be checked for correct style, part number, and physical properties such as size or the presence of physical damage. Do NOT use any component that displays any signs of nonconformance.

3.1.1 A careful examination of the Unit Valve and Unit Solenoid must be performed. If you purchase a Unit Valve and a Unit Solenoid, be sure that the last two digits of the Unit Valve match the first two digits of the Unit Solenoid. If they do not match then do not install.

3.1.2 Check nameplate for correct catalog number, pressure, voltage and service. Do not install if unsuitable.

3.1.3 Valves to be installed in Hazardous Locations must be outfitted with Hazardous Location coils only. Verify nameplate data and coil part number before installing the valve.

3.2 Product Assembly: Do not assemble, install or use a Parker Fluid Control Division Product in any end use or application that exceeds the specified operating parameters as listed by Parker such as but not limited to, pressure, voltage and frequency, and medium. Do not mix components or solenoids from a Parker valve with valves or solenoids from another manufacturer. Do not mix components or solenoids from one Parker valve with components or solenoids from another Parker valve.

Parker Hannifin Corporation
Fluid Control Division
1 800 825 8305 (1 800 Valve05)
www.parker.com/fcd

3.2.1 Threaded Connections: Proper procedures for the application of tape or liquid pipe sealant or thread compound must be followed so these contaminants do not enter the Product.
3.2.2 Sweating or Brazing: Products requiring the sweating or brazing of pipe connections must have precautions taken to protect the internal product components from excessive heat during the sweating or brazing operation. Follow the directions in the specific Parker Fluid Control Division publication for the Product in question.
3.2.3 Mounting: Check the specific Parker Fluid Control Division publication for the Product in question for limitations on mounting prior to mounting the Product.
3.2.4 Electrical Connection: Turn off electrical power before connecting or disconnecting the Product to the power source. Wiring must comply with local and national electrical codes.
3.2.5 Voltage: Some coils contain solid state components that can be damaged by voltage spikes, transient voltage, over temperature, over voltage, or improper assembly. To protect against premature failure, please read the instructions in the specific Parker Fluid Control Division publication for the Product in question.
3.2.6 Port Connection: Parker Product operating parameters assume that the user connects the fluid to the proper inlet, outlet and exhaust ports. Connecting to the wrong ports may result in a complete failure or degraded performance. Use caution when applying and activating the fluid connection. Take the necessary precautions to protect personnel and property from injury and damage when turning on the fluid to the Product. Make sure the voltage is in the correct state (on or off) to control the applied pressure as required for the application in question.
3.2.7 Screw Terminal Coil and Terminal Box Assembly: When the DIN or screw terminal coils are used with the terminal box assembly, be sure to apply a wrench to the wrench flats on the conduit hub when installing electrical conduit.
3.2.8 Pressure: Turn off line pressure and bleed off trapped pressure from the lines before installing, removing or disassembling the Product.

4.0 PRODUCT AND SYSTEM OPERATION INSTRUCTIONS

4.1 Pressure Differential: Pressure differential dependent Products require a minimum pressure differential to operate properly. Make sure the chosen Product is sized properly for the application to maintain the required pressure differential across the Product.
4.2 System Check-out: Once installed, the Product installation must be tested to insure proper operation and that no external leakage exists. All safety equipment must be in place including but not limited to safety glasses, helmets, ear protection, splash guards, coveralls and any shields on the equipment. All air entrapment must be eliminated and the system pressurized to the maximum system pressure (at or below the Product maximum working pressure) and checked for proper function and freedom from leaks. Personnel must stay out of potentially hazardous areas while testing and using.

5.0 PRODUCT MAINTENANCE AND REPLACEMENT INSTRUCTIONS

5.1 Maintenance: Even with proper selection and installation, Product life or performance may be significantly reduced without a continuing maintenance program. The severity of the application, risk potential from a possible Product failure, and experience with any Product failures in the application or in similar applications should determine the frequency of the inspection and the replacement for the Products so that Products are replaced before any failure occurs. A maintenance program must be established and followed by the user and, at minimum, must include instructions 5.1.1 through 5.1.3.
5.1.1 Product Lubrication and filtration: Almost all products require filtration. Consult the specific Parker Fluid Control Division publication for the Product in question. Note, too, that some Products require lubrication or filtration or both as a regular maintenance item due to the nature of the application's environment. Consult the specific Fluid Control Division publication for the Product in question to determine this. Other Products, such as proportional valves, do not require any maintenance if the fluid is properly filtered. If a failure should occur, then these proportional valves should not be repaired but replaced.
5.1.2 Cleaning: Do not expose plastic or elastomeric materials to any type of commercial cleaning fluid. Parts should be cleaned with a mild soap and water solution.
5.1.3 Fluid Spills: Necessary precautions should be taken during maintenance to avoid exposing personnel or the surrounding area to any spilled fluid if the fluid is regulated, harmful, or damaging when exposed to or in contact with personnel or the surrounding environment.
5.2 Service and Repair:
5.2.1 General: Do not repair Products unless the specific Fluid Control Division publication for the Product in question allows this procedure. Not all Products can be safely repaired in the field. Repair and replacement must be in accordance with the specific Parker Fluid Control Division publication for the Product in question and any Parker replacement kit instructions.
5.2.2 Replacement Parts: If you purchase any replacement parts they must be original equipment manufactured by Parker Fluid Control Division.
5.2.3 Lock-Out / Tag-Out: Follow all lock-out and tag-out procedures before undertaking service or repairs. This includes de-energizing all electrical, fluid and mechanical energy sources.
5.2.4 Hazardous Location Coils - When replacing coils, Products equipped with Hazardous Location coils must use Hazardous Location replacement coils only. Verify nameplate data and coil part number before installing the replacement coil.

Terms & Conditions of Sale

Offer Of Sale: The items described in this document are hereby offered for sale at prices to be established by Parker Hannifin Corporation, its subsidiaries and its authorized distributors. This offer and its acceptance by any customer ("Buyer") shall be governed by all of the following Terms and Conditions. Buyer's order for any item described in its document, when communicated to Parker Hannifin Corporation, its subsidiary or an authorized distributor ("Seller"] verbally or in writing, shall constitute acceptance of this offer.

1. Terms and Conditions of Sale: All descriptions, quotations, proposals, offers, acknowledgments, acceptances and sales of Seller's products are subject to and shall be governed exclusively by the terms and conditions stated herein. Buyer's acceptance of any offer to sell is limited to these terms and conditions. Any terms or conditions in addition to, or inconsistent with those stated herein, proposed by Buyer in any acceptance of an offer by Seller, are hereby objected to. No such additional, different or inconsistent terms and conditions shall become part of the contract between Buyer and Seller unless expressly accepted in writing by Seller. Seller's acceptance of any offer to purchase by Buyer is expressly conditional upon Buyer's assent to all the terms and conditions stated herein, including any terms in addition to, or inconsistent with those contained in Buyer's offer. Acceptance of Seller's products shall in all events constitute such assent.

2. Payment: Payment shall be made by Buyer net 30 days from the date of delivery of the items purchased hereunder. Any claims by Buyer for omissions or shortages in a shipment shall be waived unless Seller receives notice thereof within 30 days after Buyer's receipt of the shipment. The minimum order amount is $125.00 net, unless otherwise noted on the quotation .

3. Delivery: Unless otherwise provided on the face hereof, delivery shall be made F.O.B. Seller's plant. Regardless of the method of delivery, however, risk of loss shall pass to Buyer upon Seller's delivery to a carrier. Any delivery dates shown are approximate only and Seller shall have no liability for any delays in delivery. Shipments are made by common carrier. Any premium freight must be requested and paid for by the Buyer.

4. Warranty: Seller warrants that the items sold hereunder shall be free from defects in material or workmanship for a period of 2 years from the date of shipment to Buyer, or 2,000 hours of use, whichever expires first. Exception to this is the Angle Body Valve line has a 1 year warranty. THIS WARRANTY COMPRISES THE SOLE AND ENTIRE WARRANTY PERTAINING TO ITEMS PROVIDED HEREUNDER. SELLER MAKES NO OTHER WARRANTY, GUARANTEE, OR REPRESENTA TION OF ANY KIND WHATSOEVER. ALL OTHER WARRANTIES, INCLUDING BUT NOT LIMITED TO, MERCHANTABILITY AND FITNESS FOR PURPOSE, WHETHER EXPRESS, IMPLIED, OR ARIS. ING BY OPERATION OF LAW, TRADE USAGE, OR COURSE OF DEAL ING ARE HEREBY DISCLAIMED. NOTWITHSTANDING THE FOREGOING, THERE ARE NO WARRANTIES WHATSOEVER ON ITEMS BUILT OR ACQUIRED WHOLLY OR PARTIALLY, TO BUYER'S DESIGNS OR SPECIFICATIONS.

5. Limitation Of Remedy: SELLER'S LIABILITY ARISING FROM OR IN ANY WAY CONNECTED WITH THE ITEMS SOLD OR THIS CONTRACT SHALL BE LIMITED EXCLUSIVELY TO REPAIR OR REPLACEMENT OF THE ITEMS SOLD OR REFUND OF THE PURCHASE PRICE PAID BY BUYER, AT SELLER'S SOLE OPTION. IN NO EVENT SHALL SELLER BE LIABLE FOR ANY INCIDENTAL, CONSEQUENTIAL OR SPECIAL DAMAGES OF ANY KIND OR NATURE WHATSOEVER, INCLUDING BUT NOT LIMITED TO LOST PROFITS ARISING FROM OR IN ANY WAY CONNECTED WITH THIS AGREEMENT OR ITEMS SOLD HEREUNDER, WHETHER ALLEGED TO ARISE FROM BREACH OF CONTRACT, EXPRESS OR IMPLIED WARRANTY, OR IN TORT, INCLUDING WITHOUT LIMITATION, NEGLIGENCE, FAILURE TO WARN OR STRICT LIABILITY.

6. Changes, Reschedules and Cancellations: Buyer may request to modify the designs or specifications for the items sold hereunder as well as the quantities and delivery dates thereof, or may request to cancel all or part of this order, however, no such requested modification or cancellation shall become part of the contract between Buyer and Seller unless accepted by Seller in a written amendment to this Agreement. Acceptance of any such requested modification or cancellation shall be at Seller's discretion, and shall be upon such terms and conditions as Seller may require.

7. Special Tooling: A tooling charge may be imposed for any special tooling, including without limitation, dies, fixtures, molds and patterns, acquired to manufacture items sold pursuant to this contract. Such special tooling shall be and remain Seller's property notwithstanding payment of any charges by Buyer. In no event will Buyer acquire any interest in apparatus belonging to Seller which is utilized in the manufacture of the items sold hereunder, even if such apparatus has been specially converted or adapted for such manufacture and notwithstanding any charges paid by Buyer. Unless otherwise agreed, Seller shall have the right to alter, discard or otherwise dispose of any special tooling or other property in its sole discretion at any time.

8. Buyer's Property: Any designs, tools, patterns, materials, drawings, confidential information or equipment furnished by Buyer or any other items which become Buyer's property, may be considered obsolete and may be destroyed by Seller after two (2) consecutive years have elapsed without Buyer placing an order for the items which are manufactured using such property. Seller shall not be responsible for any loss or damage to such property while it is in Seller's possession or control.

9. Taxes: Unless otherwise indicated on the face hereof, all prices and charges are exclusive of excise, sales, use, property, occupational or like taxes which may be imposed by any taxing authority upon the manufacture, sale or delivery of the items sold hereunder. If any such taxes must be paid by Seller or if Seller is liable for the collection of such tax, the amount thereof shall be in addition to the amounts for the items sold. Buyer agrees to pay all such taxes or to reimburse Seller therefore upon receipt of its invoice. If Buyer claims exemption from any sales, use or other tax imposed by any taxing authority, Buyer shall save Seller harmless from and against any such tax, together with any interest or penalties thereon which may be assessed if the items are held to be taxable.

10. Indemnity For Infringement of Intellectual Property Rights: Seller shall have no liability for infringement of any patents, trademarks, copyrights, trade dress, trade secrets or similar rights except as provided in this Part 10. Seller will defend and indemnify Buyer against allegations of infringement of U.S. patents, U.S. trademarks, copyrights, trade dress and trade secrets (hereinafter 'Intellectual Property Rights'). Seller will defend at its expense and will pay the cost of any settlement or damages awarded in an action brought against Buyer based on an allegation that an item sold pursuant to this contract infringes the Intellectual Property Rights of a third party. Seller's obligation to defend and indemnify Buyer is contingent on Buyer notifying Seller within ten (10) days after Buyer becomes aware of such allegations of infringement, and Seller having sole control over the defense of any allegations or actions including all negotiations for settlement or compromise. If an item sold hereunder is subject to a claim that it infringes the Intellectual Property Rights of a third party, Seller may, at its sole expense and option, procure for Buyer the right to continue using said item, replace or modify said item so as to make it noninfringing, or offer to accept return of said item and return the purchase price less a reasonable allowance for depreciation. Notwithstanding the foregoing, Seller shall have no liability for claims of infringement based on information provided by Buyer, or directed to items delivered hereunder for which the designs are specified in whole or part by Buyer, or infringements resulting from the modification, combination or use in a system of any item sold hereunder. The foregoing provisions of this Part 10 shall constitute Seller's sole and exclusive liability and Buyer's sole and exclusive remedy for infringement of Intellectual Property Rights.

If a claim is based on information provided by Buyer or if the design for an item delivered hereunder is specified in whole or in part by Buyer, Buyer shall defend and indemnify Seller for all costs, expenses or judgments resulting from any claim that such item infringes any patent, trademark, copyright, trade dress, trade secret or any similar right.

11. Force Majeure: Seller does not assume the risk of and shall not be liable for delay or failure to perform any of Seller's obligations by reason of circumstances beyond the reasonable control of Seller (hereinafter 'events of Force Majeure]. Events of Force Majeure shall include without limitation, accidents, acts of God, strikes or labor disputes, acts, laws, rules or regulations of any government or government agency, fires, floods, delays or failures in delivery of carriers or suppliers, shortages of materials and any other cause beyond Seller's control.

12. Entire Agreement/Governing Law: The terms and conditions set forth herein, together with any amendments, modifications and any different terms or conditions expressly accepted by Seller in writing, shall constitute the entire Agreement concerning the items sold, and there are no oral or other representations or agreements which pertain thereto. This Agreement shall be governed in all respects by the law of the State of Ohio. No actions arising out of the sale of the items sold hereunder or this Agreement may be brought by either party more than two (2) years after the cause of action accrues.

Parker's Motion & Control Technologies

At Parker, we're guided by a relentless drive to help our customers become more productive and achieve higher levels of profitability by engineering the best systems for their requirements. It means looking at customer applications from many angles to find new ways to create value. Whatever the motion and control technology need, Parker has the experience, breadth of product and global reach to consistently deliver. No company knows more about motion and control technology than Parker. For further info call 1 800 C-Parker (1 800 272 7537).
